π/K/p Spectra Analysis

$\sqrt{s_{NN}}$=200 GeV O+O Collisions for Space Radiation Studies

Andrew Liggett

AGENDA

What We'll Cover

1. **Physics motivation for O+O**
   Oxygen as a galactic cosmic ray proxy -- why O+O collisions matter for space radiation and shielding models.

2. **Detector, tracking, and event-quality checks**
   Acceptance, PID, dE/dx and BTOF fit diagnostics, and event QA.

3. **Yield extraction and corrected spectra**
   From raw TPC/BTOF yields through corrected mT-m0 spectra -- now complete for π/K/p.

4. **Status and next steps**
   Where the analysis stands -- eTOF calibration ongoing, corrected spectra underway.

Space Radiation Motivation

1. Oxygen as a galactic cosmic ray proxy

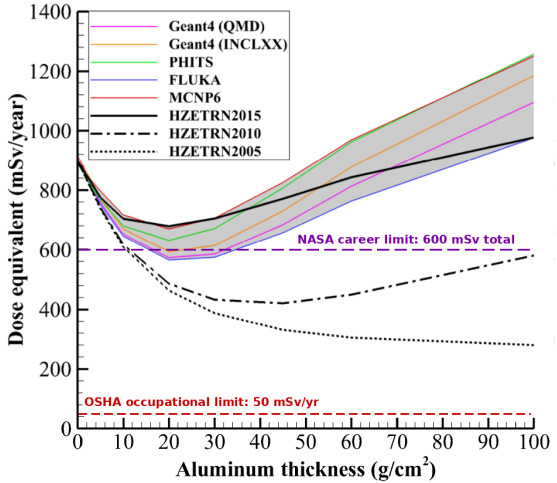

Oxygen is a major heavy-ion component of galactic cosmic rays -- O+O collisions probe the same nuclear fragmentation GCRs undergo in spacecraft shielding and human tissue.

2. Benchmarking models and shielding design

Identified π/K/p yields benchmark hadronic models (FLUKA, GEANT4, PHITS) and feed into shielding design and astronaut dose/ risk estimates for long-duration missions.

3. Quantifying the fractional dose

Rapidity stopping and spectra measure participants and fireball contribution; spectators near beam rapidity contribute to the forward dose.

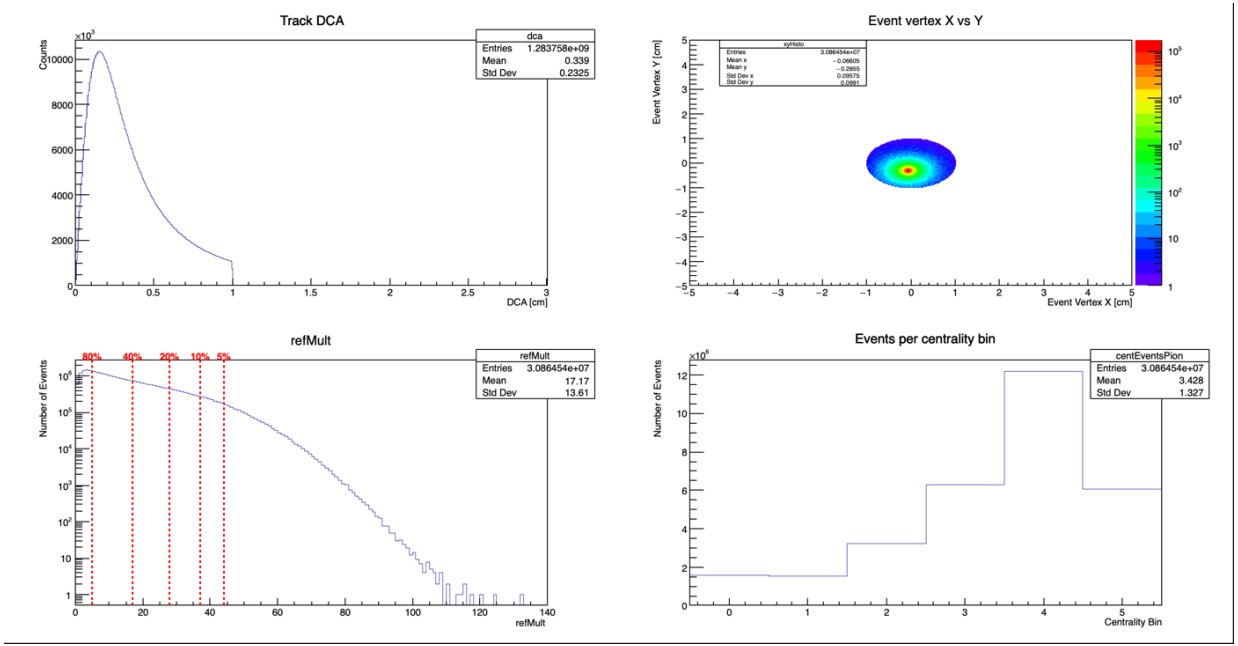

(a)

Dose equivalent vs. aluminum shielding -- Monte Carlo codes (incl. FLUKA) vs. HZETRN versions. Norbury, Slaba et al. (2019); OSHA and NASA limit lines added (NASA's is a career total, not annual).

Event Selection Cuts

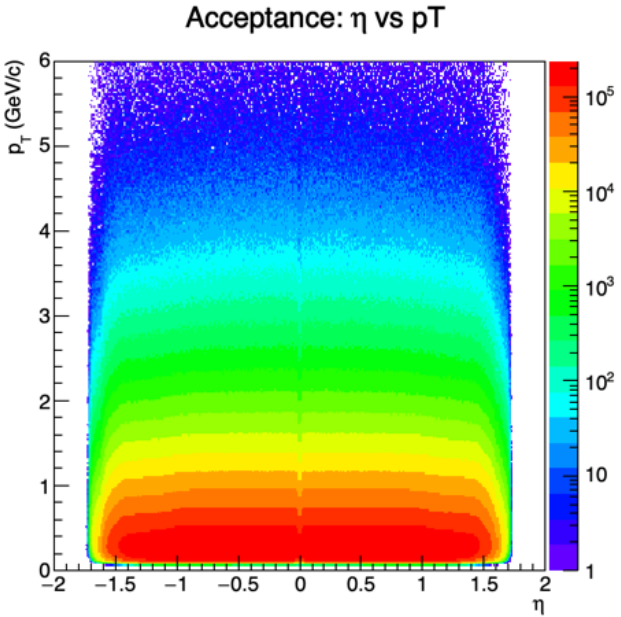

Cut	Value
Vertex Vz	[-2, 2] cm
Vertex Vr	<= 1.0 cm
Trigger ID	860003
Global DCA	<= 1.0 cm
Centrality Bins	0-5%, 5-10%, 10-20%, 20-40%, 40-80%, 80-100% (raw refMult)

Event QA: Trigger Cut Verified

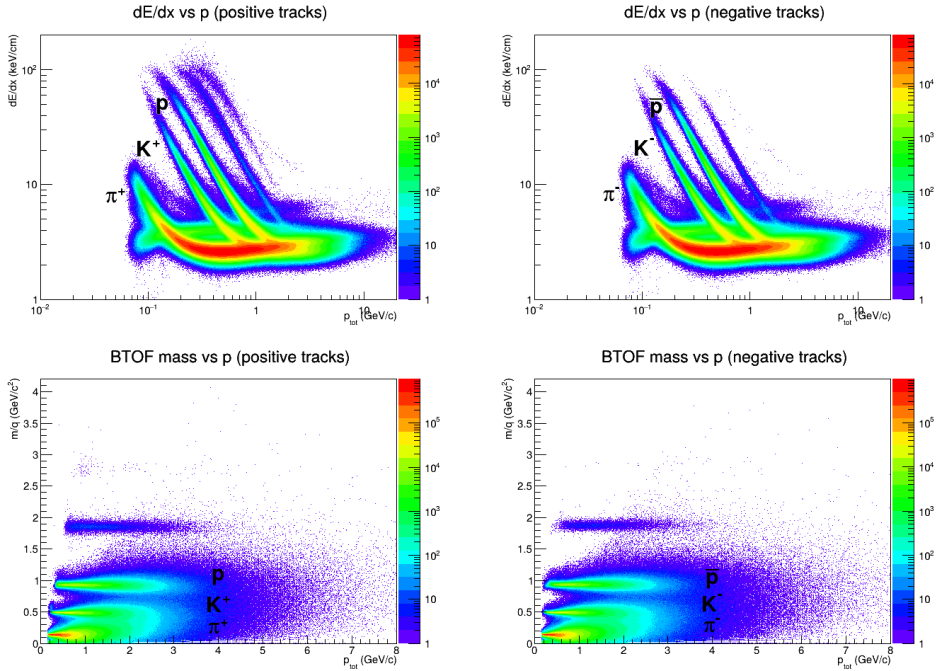

PION event QA: DCA, vertex XY, refMult centrality cuts, and events per centrality bin.

Acceptance: η vs pT

TPC-only acceptance in pseudorapidity (eta) vs pT -- defines the kinematic reach of the analysis.

Particle ID: TPC dE/dx and BTOF m/q

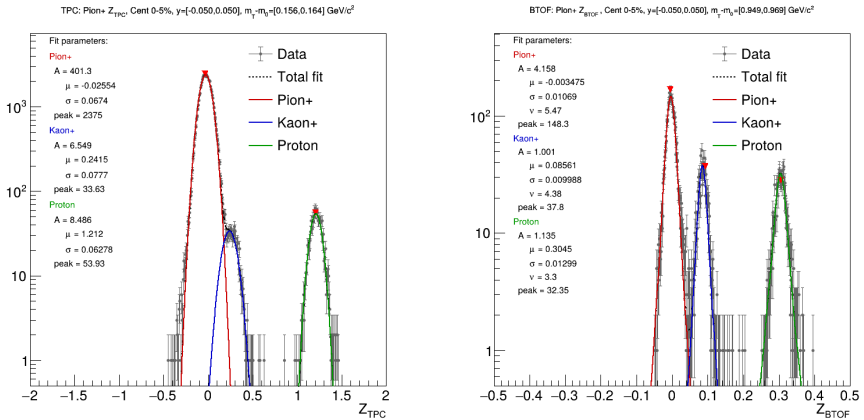

TPC dE/dx vs p and BTOF mass vs p for positive and negative tracks -- pi/K/p bands are cleanly separated.

Extracting Yields: dE/dx & Inverse-Beta Fits

$$Z_{\mathrm{TPC}} = \ln\left[\frac{(dE/dx)_{\mathrm{meas}}}{(dE/dx)_{\mathrm{Bichsel}}(p,\ \mathrm{species})}\right]$$

$$Z_{\mathrm{BTOF}} = \left(\frac{1}{\beta}\right)_{\mathrm{meas}} - \left(\frac{1}{\beta}\right)_{\mathrm{expected}}(p,\ \mathrm{mass}) \qquad \text{where } \left(\frac{1}{\beta}\right)_{\mathrm{expected}}(p, m) = \sqrt{1 + \frac{m^2}{p^2}}$$

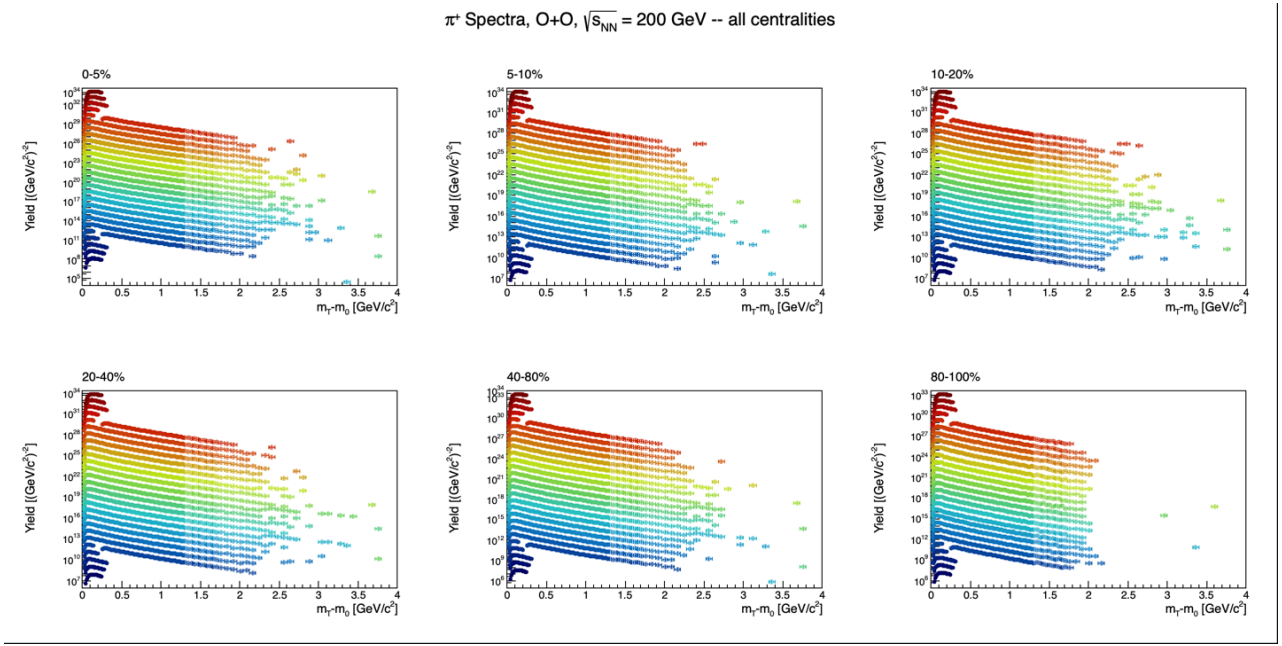

Example Gaussian (TPC) and Student's-t (BTOF) fits to pion-yield data -- pion+/kaon+/proton components, 0-5% centrality.

Spectra Corrections: Status

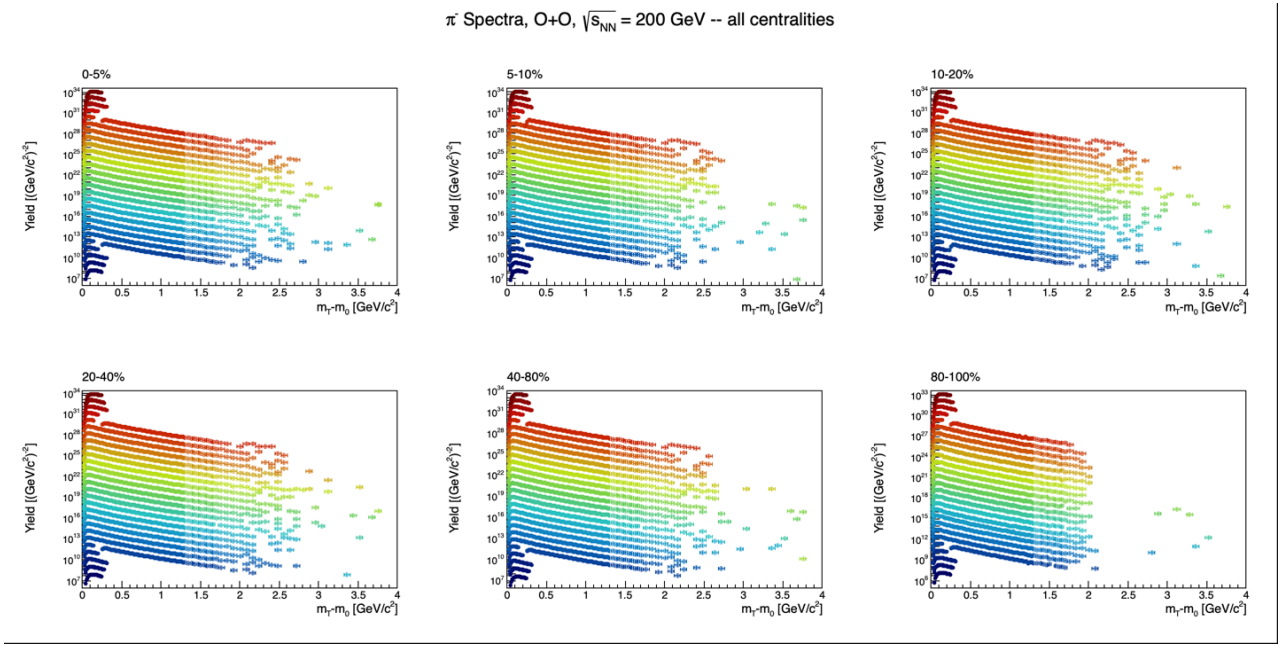

Correction	Status	Notes
BTOF efficiency	**Done**	Data-driven: ratio of TPC-identified tracks with a matching BTOF hit to all TPC-identified tracks, fit vs mT-m0.
TPC efficiency	Not yet applied	Will use embedding to derive the efficiency correction.
Energy loss	Not yet applied	Uses the same embedding as TPC efficiency -- applied in the same call.
Hybrid feed-down	Not yet applied	Also draws on the same embedding; will be enabled once the correction is applied.

Pion+: Combined All-Centralities Spectra View

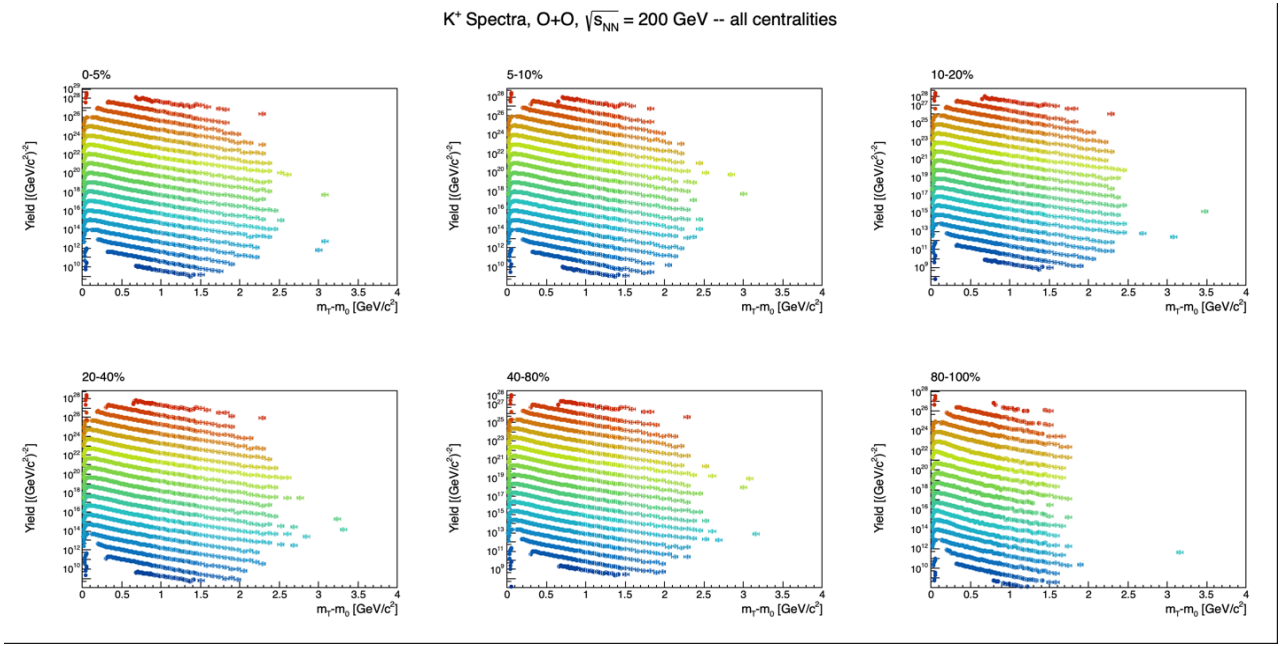

BTOF-corrected pion+ mT-m0 spectra, TPC+BTOF combined, all six centrality bins, all rapidity bins together.

Pion-: Combined All-Centralities Spectra View

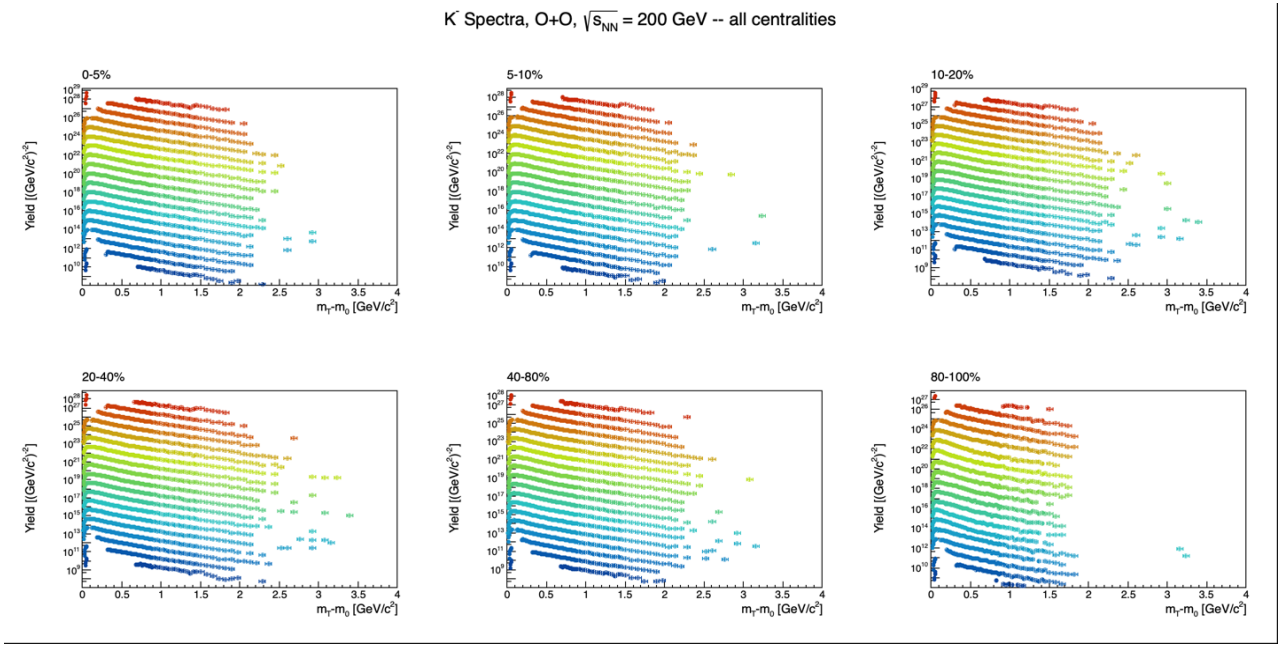

BTOF-corrected pion- mT-m0 spectra, TPC+BTOF combined, all six centrality bins, all rapidity bins together.

Kaon+: Combined All-Centralities Spectra View

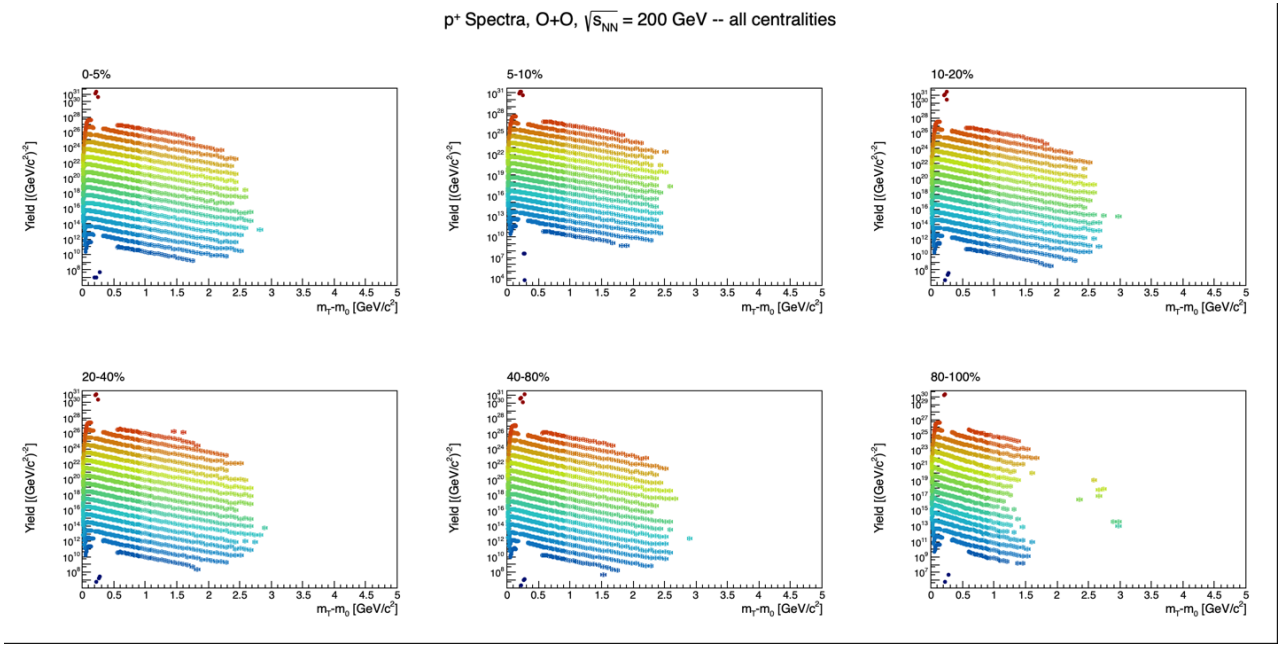

BTOF-corrected kaon+ mT-m0 spectra, TPC+BTOF combined, all six centrality bins, all rapidity bins together.

Kaon-: Combined All-Centralities Spectra View

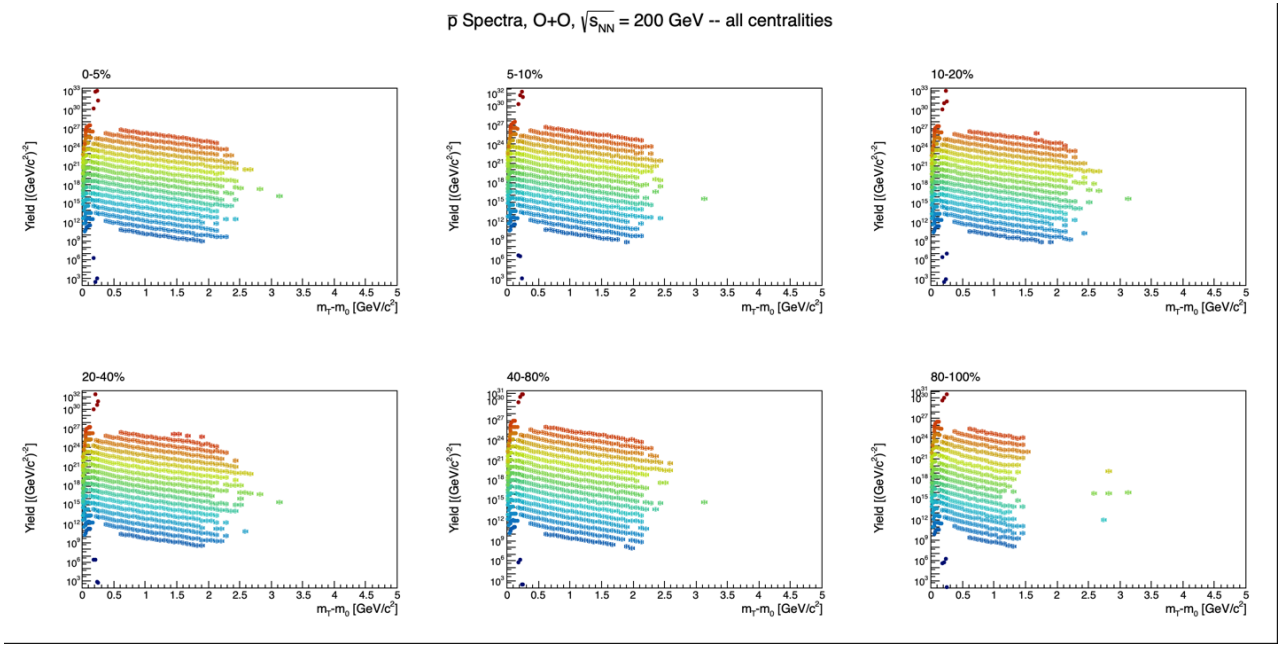

BTOF-corrected kaon- mT-m0 spectra, TPC+BTOF combined, all six centrality bins, all rapidity bins together.

Proton+: Combined All-Centralities Spectra View

BTOF-corrected proton+ mT-m0 spectra, TPC+BTOF combined, all six centrality bins, all rapidity bins together.

Antiproton: All-Centralities Spectra View

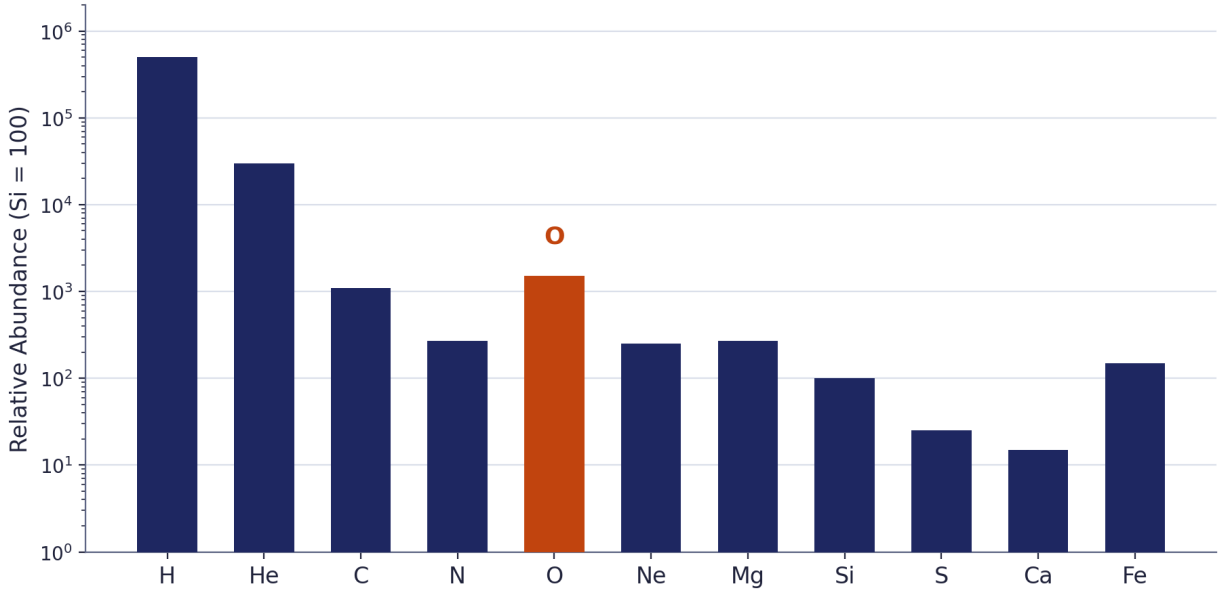

BTOF-corrected antiproton mT-m0 spectra, TPC+BTOF combined, all six centrality bins, all rapidity bins together.

Summary & Next Steps

- **Motivation** -- O+O collisions as a galactic cosmic ray proxy for space radiation and shielding studies, use spectra analysis to determine fractional dosages
- **BTOF-corrected spectra produced for π/K/p** -- all six centrality bins, TPC+BTOF combined.
- **Currently working on eTOF calibrations** -- MuDsts restored; this would be the first use of eTOF at 200 GeV.
- **Apply Embedding** -- TPC efficiency, energy loss, and hybrid feed-down

BACKUP

GCR Elemental Composition

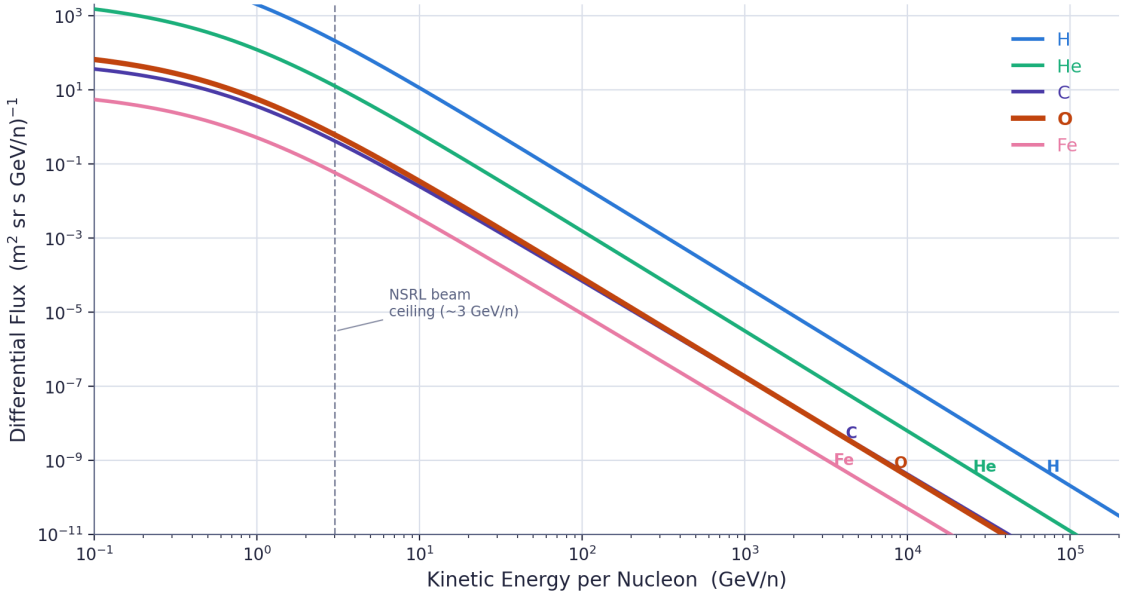

Oxygen is a major primary GCR component and spallation parent -- directly relevant to the O+O system studied here.

Source: Simpson (1983), Ann. Rev. Nucl. Part. Sci. 33:323; ACE-CRIS (Caltech ACE News #83). Representative reconstruction, not a digitized figure.

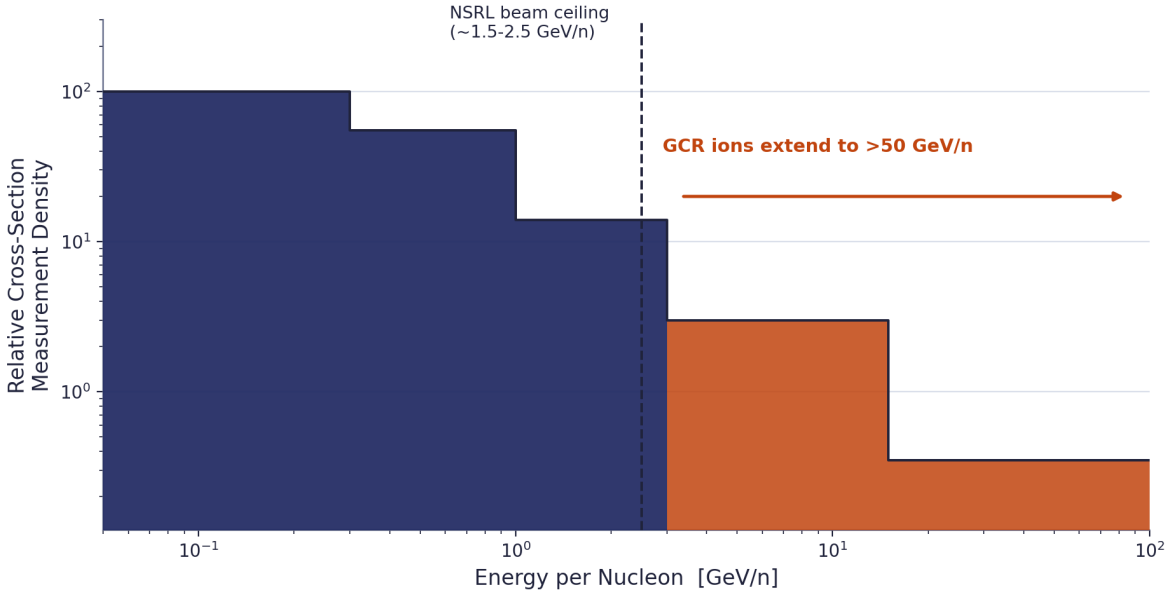

BACKUP

GCR Energy Spectrum by Element

Sources: PDG "Cosmic Rays" review; Ahn et al. 2009, ApJ 707:593 (CREAM); Simpson (1983) abundances. Representative reconstruction, not a digitized figure.

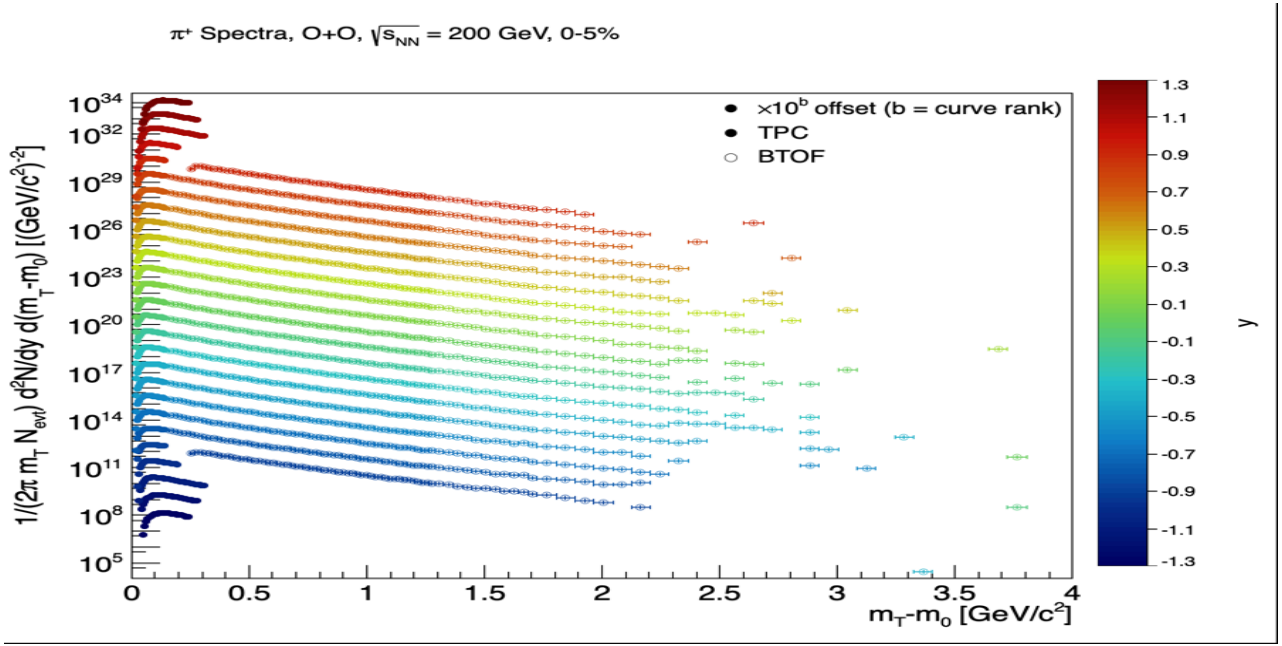

Nuclear Data Coverage Gap

FLUKA/GEANT4/PHITS are tuned to measured cross sections -- data thins sharply above ~3 GeV/n, beyond NSRL's beam ceiling.

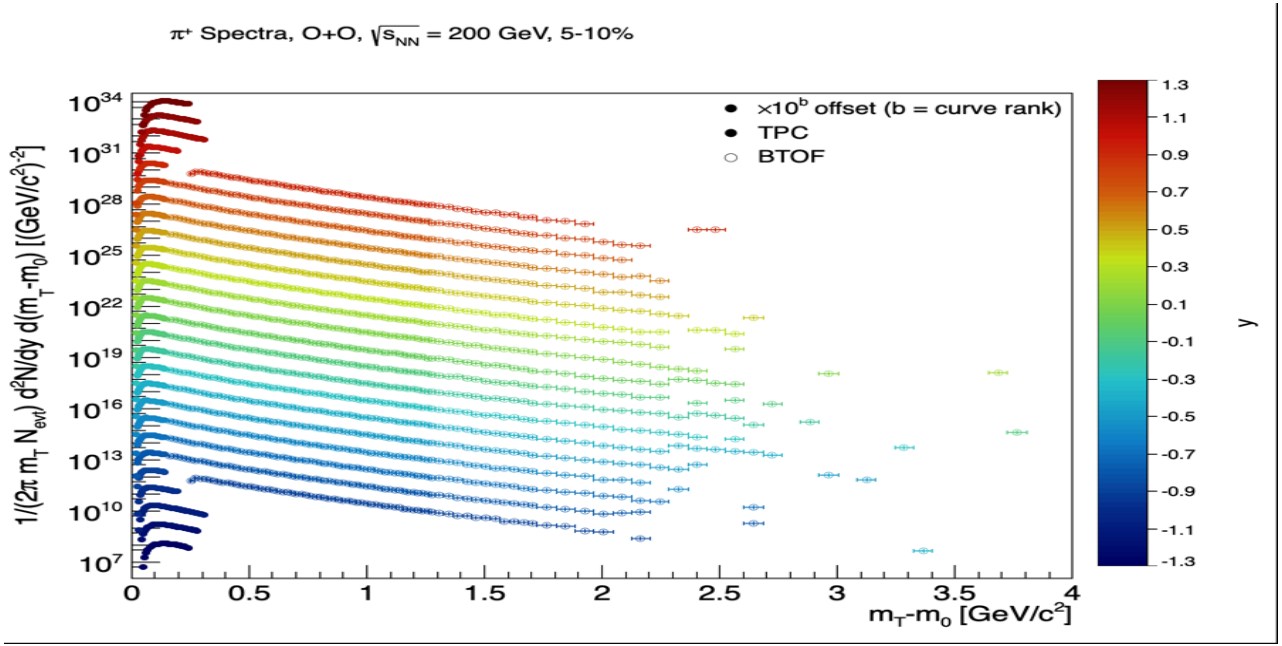

Source: Norbury & Losekamm, NASA NTRS 20240015733; NSRL beam specs, BNL. Representative reconstruction, not a digitized figure.

Pion+: 0-5% Centrality

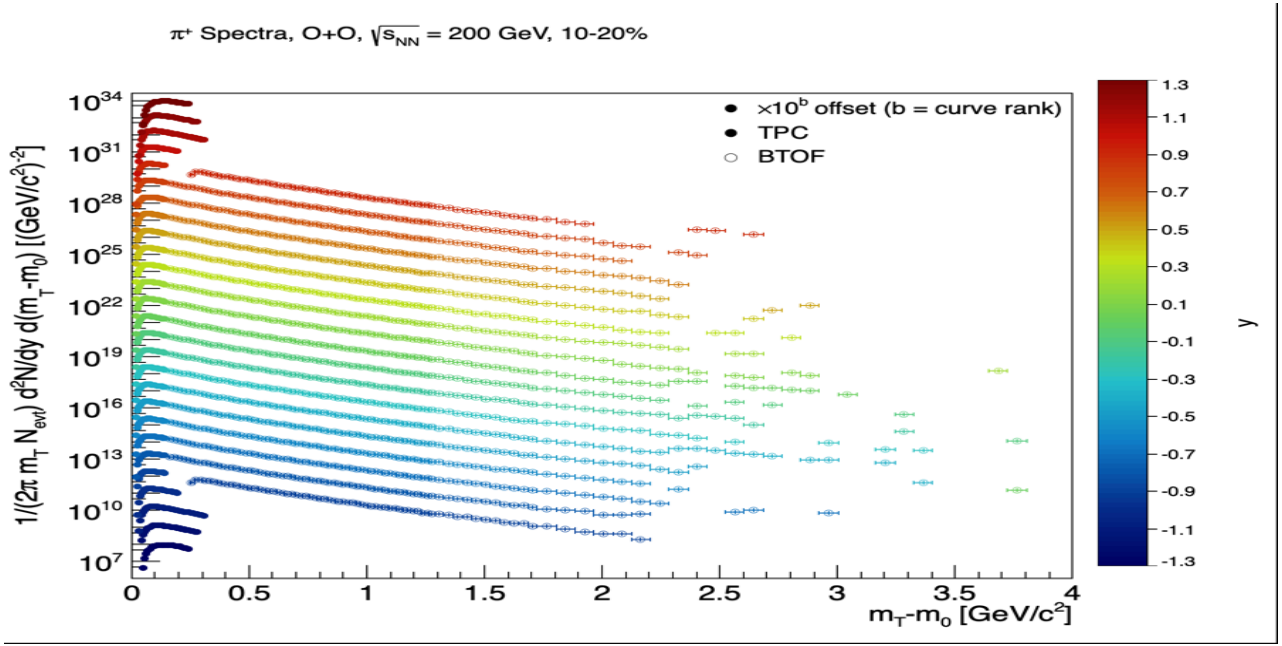

BTOF-corrected pion+ mT-m0 spectra, 0-5% centrality, TPC+BTOF, all rapidity bins.

Pion+: 5-10% Centrality

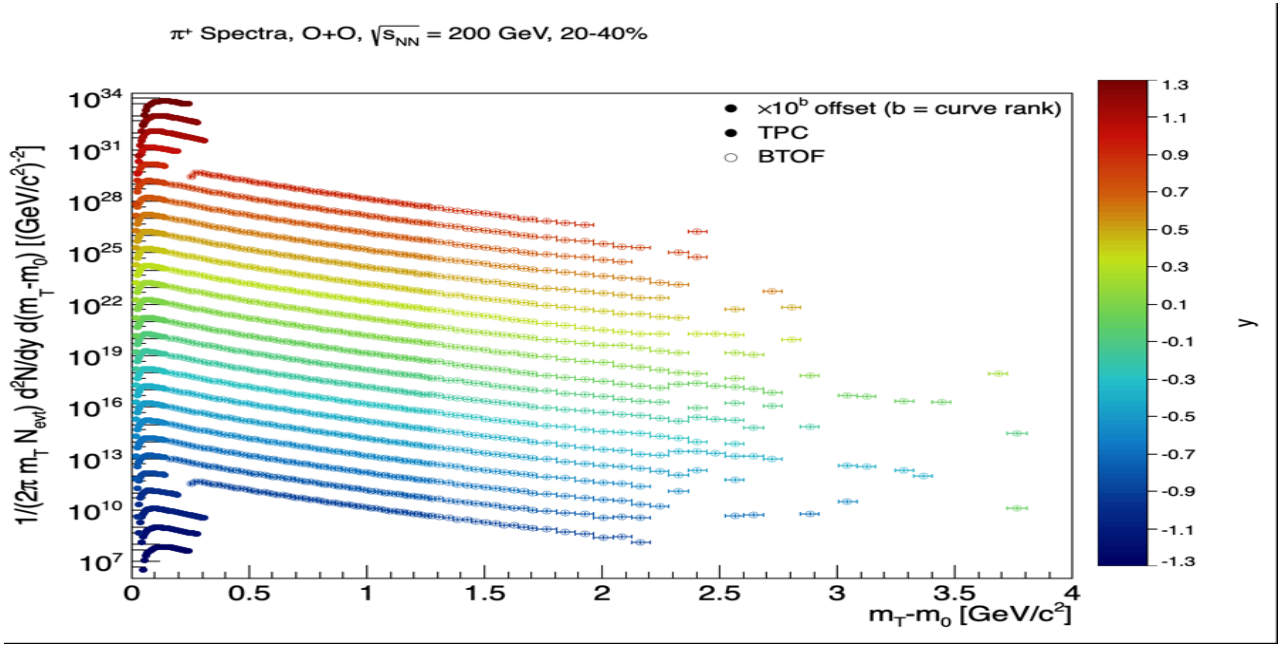

BTOF-corrected pion+ mT-m0 spectra, 5-10% centrality, TPC+BTOF, all rapidity bins.

Pion+: 10-20% Centrality

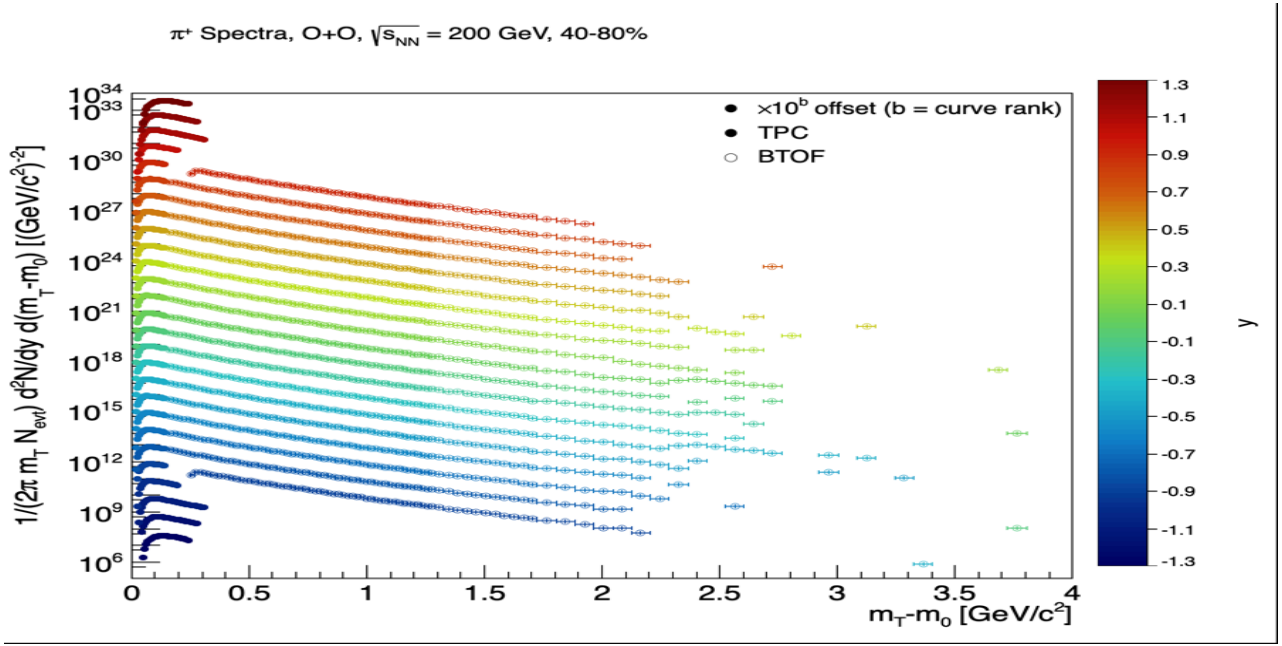

BTOF-corrected pion+ mT-m0 spectra, 10-20% centrality, TPC+BTOF, all rapidity bins.

Pion+: 20-40% Centrality

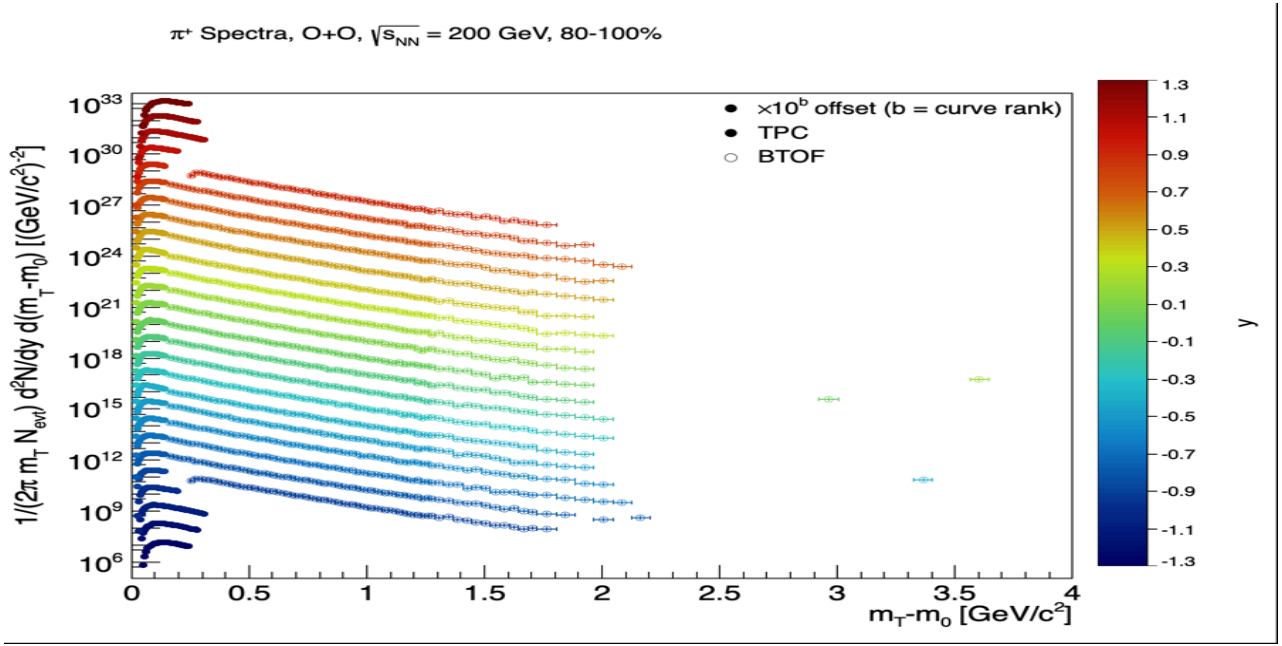

BTOF-corrected pion+ mT-m0 spectra, 20-40% centrality, TPC+BTOF, all rapidity bins.

Pion+: 40-80% Centrality

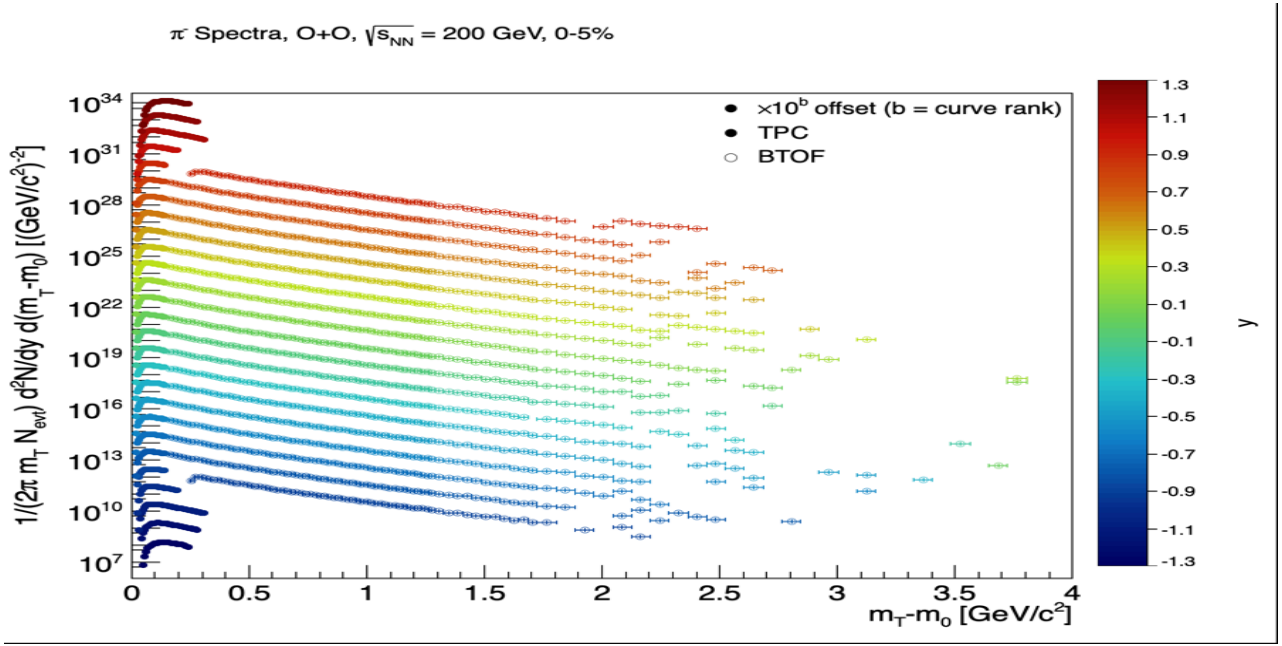

BTOF-corrected pion+ mT-m0 spectra, 40-80% centrality, TPC+BTOF, all rapidity bins.

Pion+: 80-100% Centrality

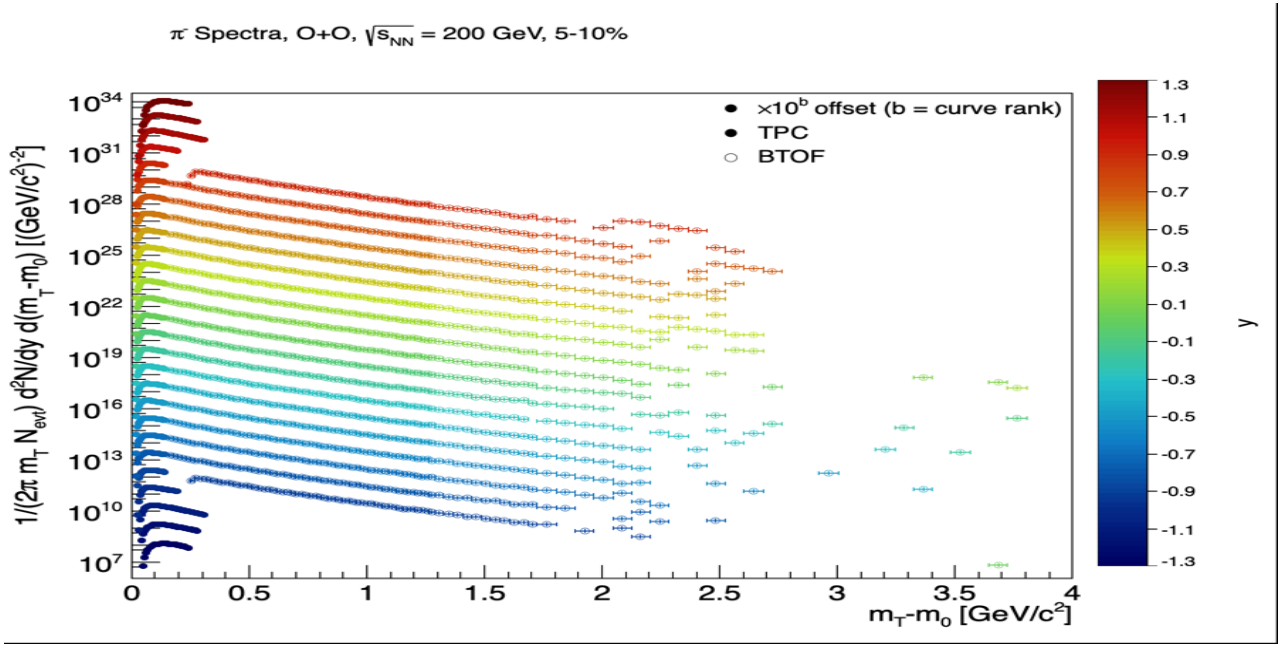

BTOF-corrected pion+ mT-m0 spectra, 80-100% centrality, TPC+BTOF, all rapidity bins.

Pion-: 0-5% Centrality

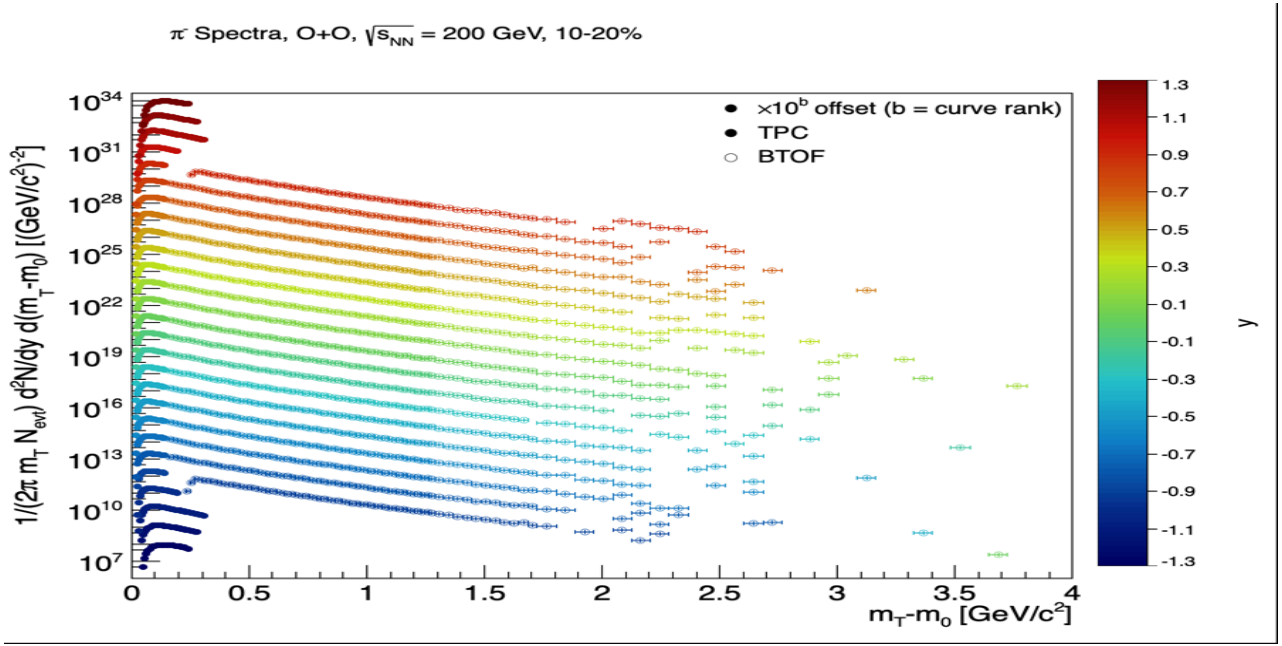

BTOF-corrected pion- mT-m0 spectra, 0-5% centrality, TPC+BTOF, all rapidity bins.

Pion-: 5-10% Centrality

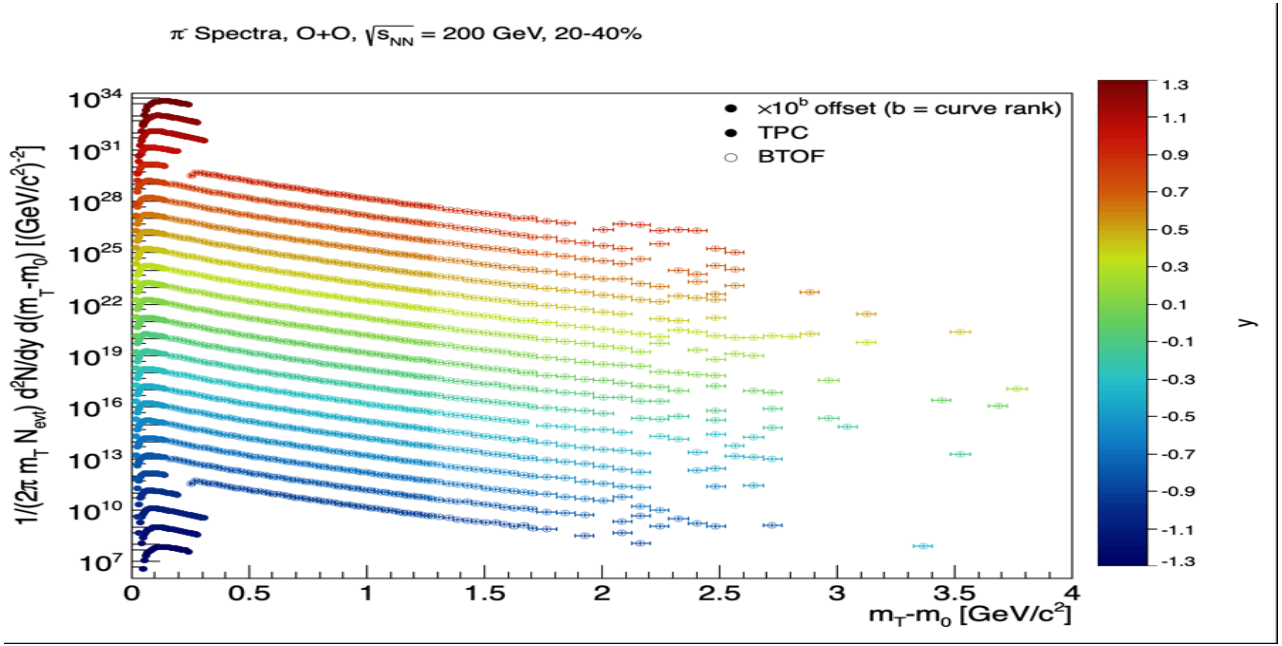

BTOF-corrected pion- mT-m0 spectra, 5-10% centrality, TPC+BTOF, all rapidity bins.

Pion-: 10-20% Centrality

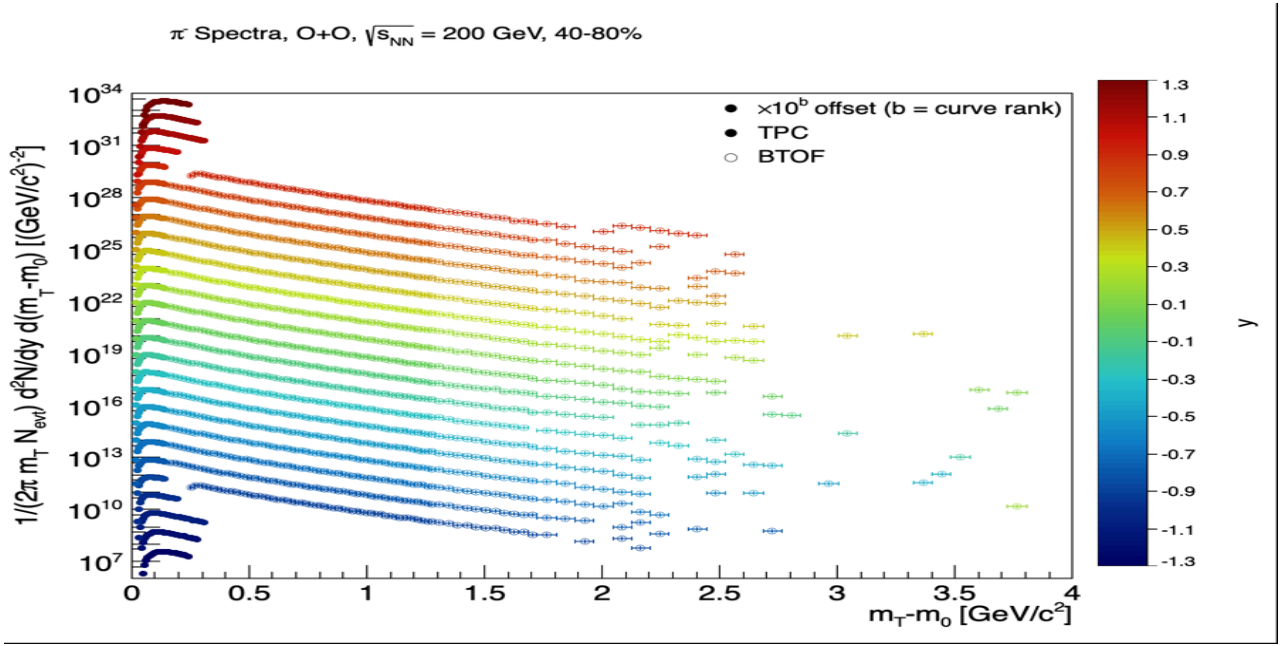

BTOF-corrected pion- mT-m0 spectra, 10-20% centrality, TPC+BTOF, all rapidity bins.

Pion-: 20-40% Centrality

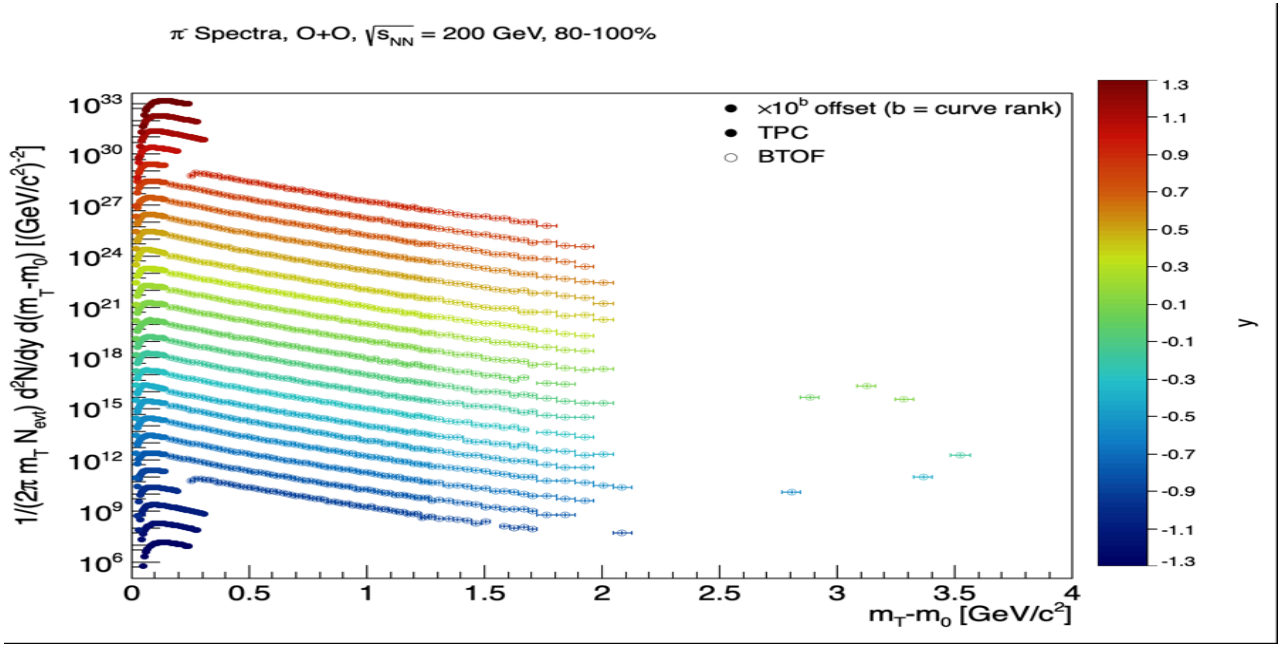

BTOF-corrected pion- mT-m0 spectra, 20-40% centrality, TPC+BTOF, all rapidity bins.

Pion-: 40-80% Centrality

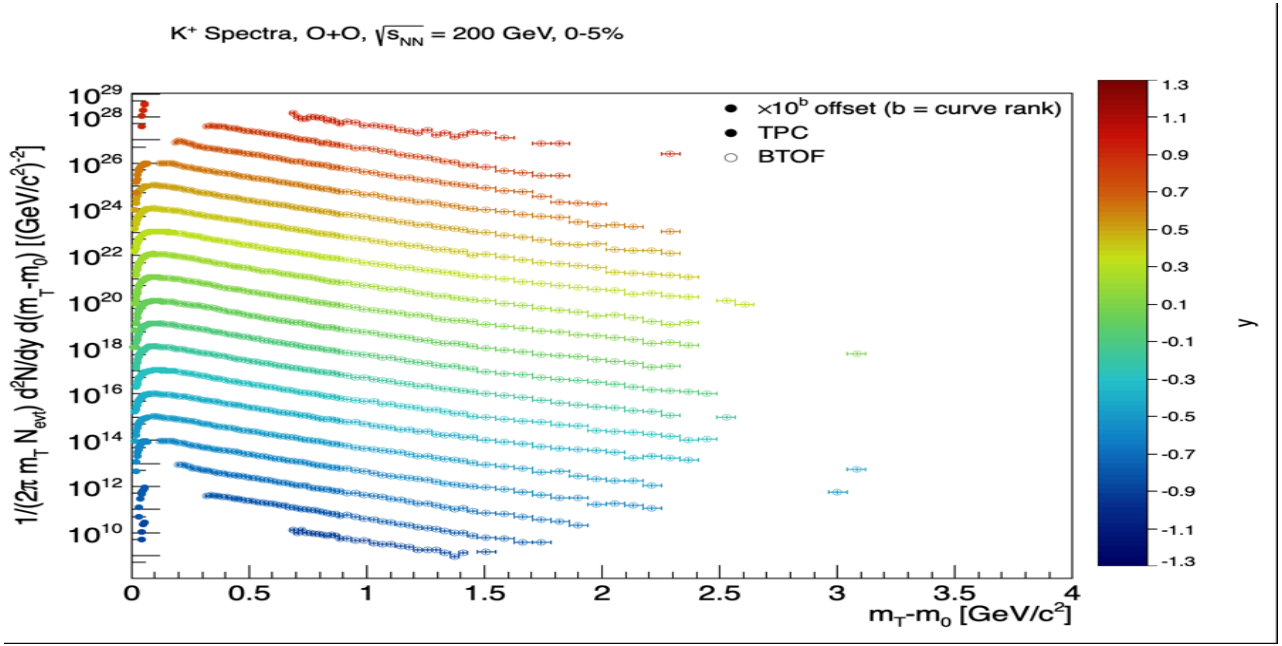

BTOF-corrected pion- mT-m0 spectra, 40-80% centrality, TPC+BTOF, all rapidity bins.

Pion-: 80-100% Centrality

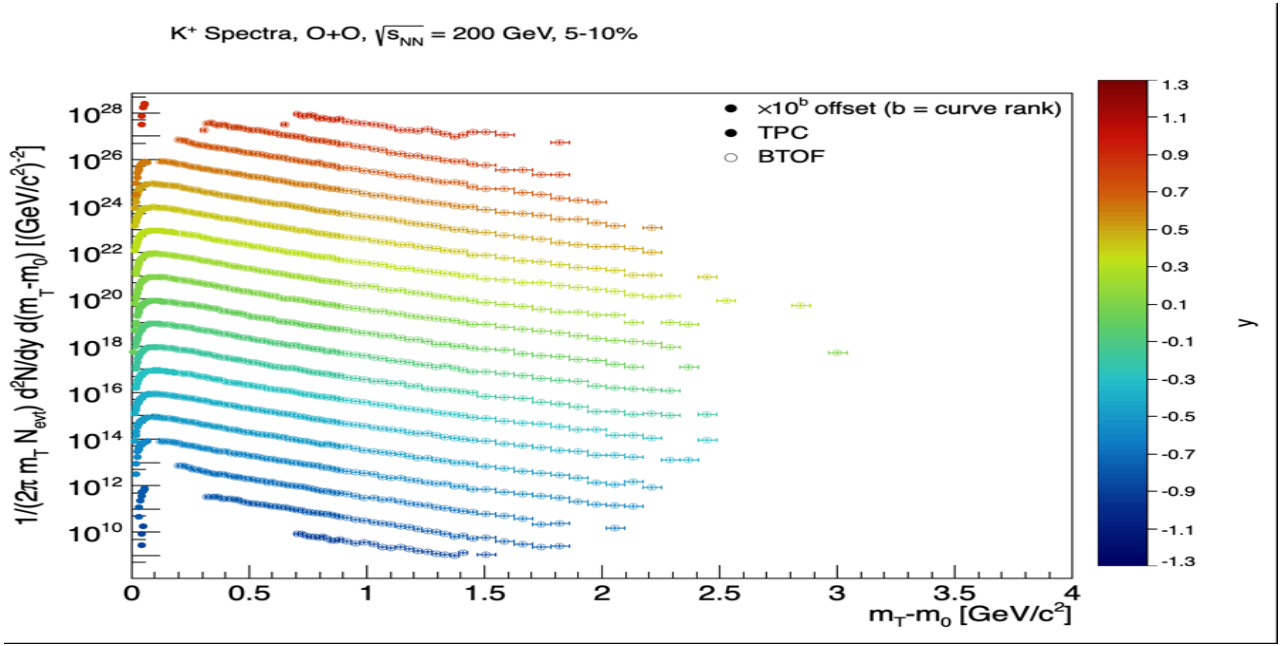

BTOF-corrected pion- mT-m0 spectra, 80-100% centrality, TPC+BTOF, all rapidity bins.

Kaon+: 0-5% Centrality

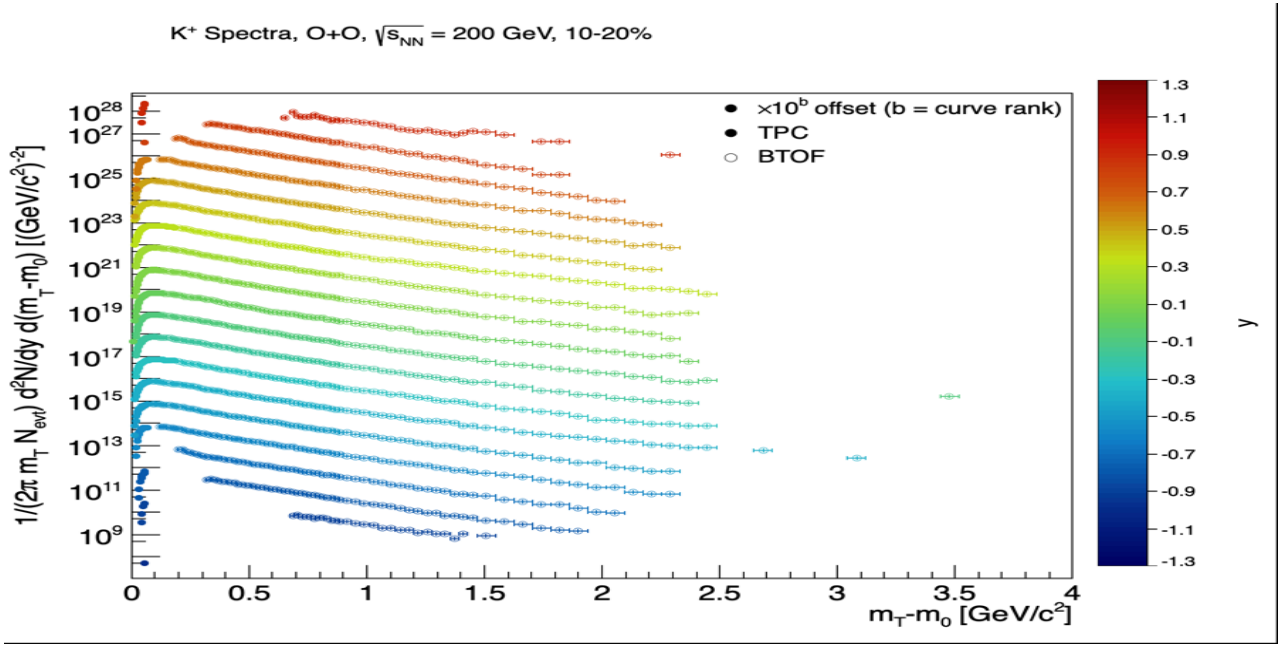

BTOF-corrected kaon+ mT-m0 spectra, 0-5% centrality, TPC+BTOF, all rapidity bins.

Kaon+: 5-10% Centrality

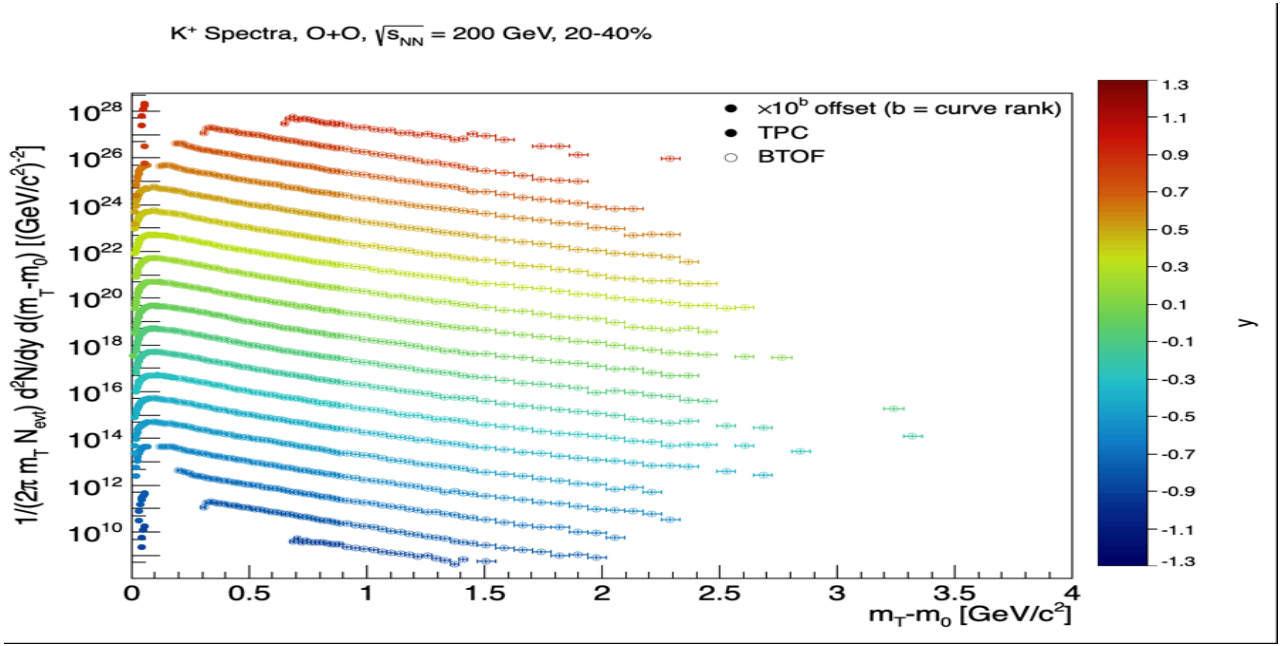

BTOF-corrected kaon+ mT-m0 spectra, 5-10% centrality, TPC+BTOF, all rapidity bins.

Kaon+: 10-20% Centrality

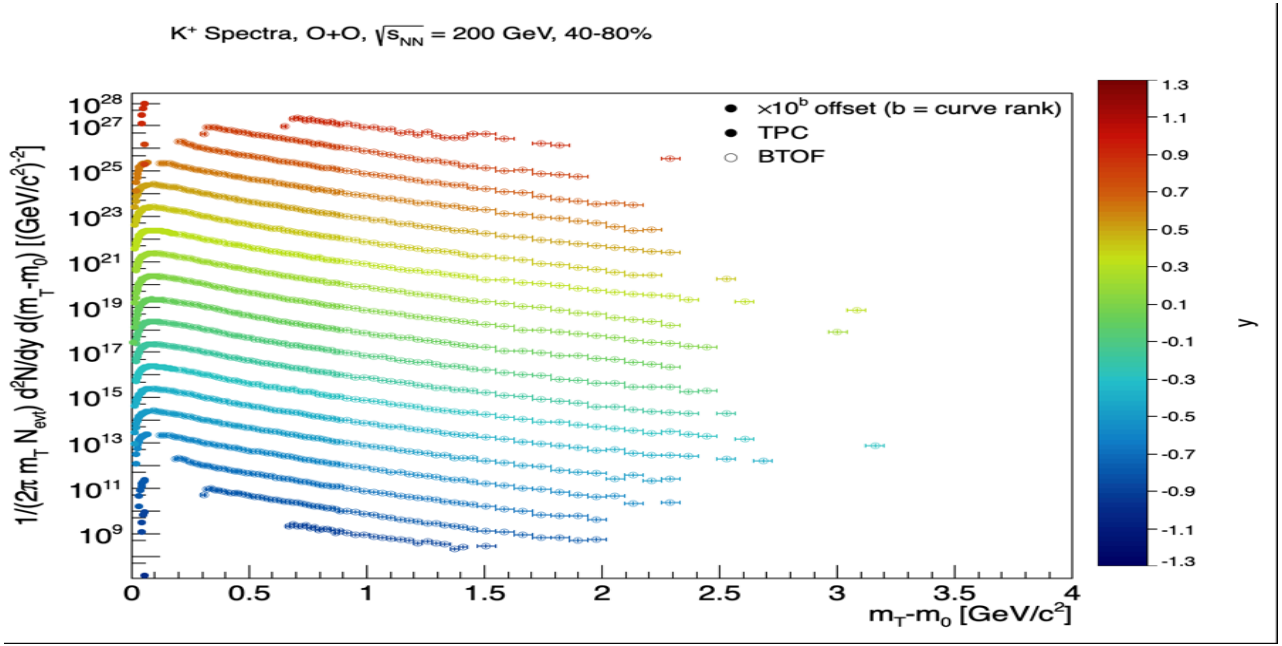

BTOF-corrected kaon+ mT-m0 spectra, 10-20% centrality, TPC+BTOF, all rapidity bins.

Kaon+: 20-40% Centrality

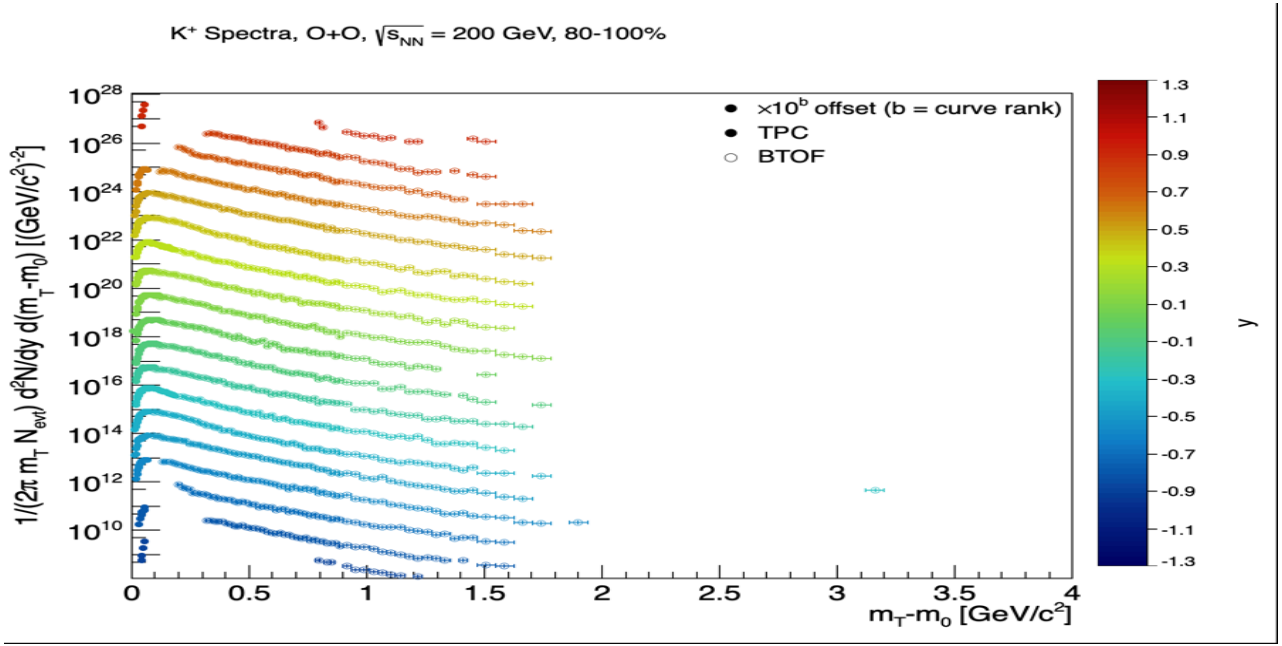

BTOF-corrected kaon+ mT-m0 spectra, 20-40% centrality, TPC+BTOF, all rapidity bins.

Kaon+: 40-80% Centrality

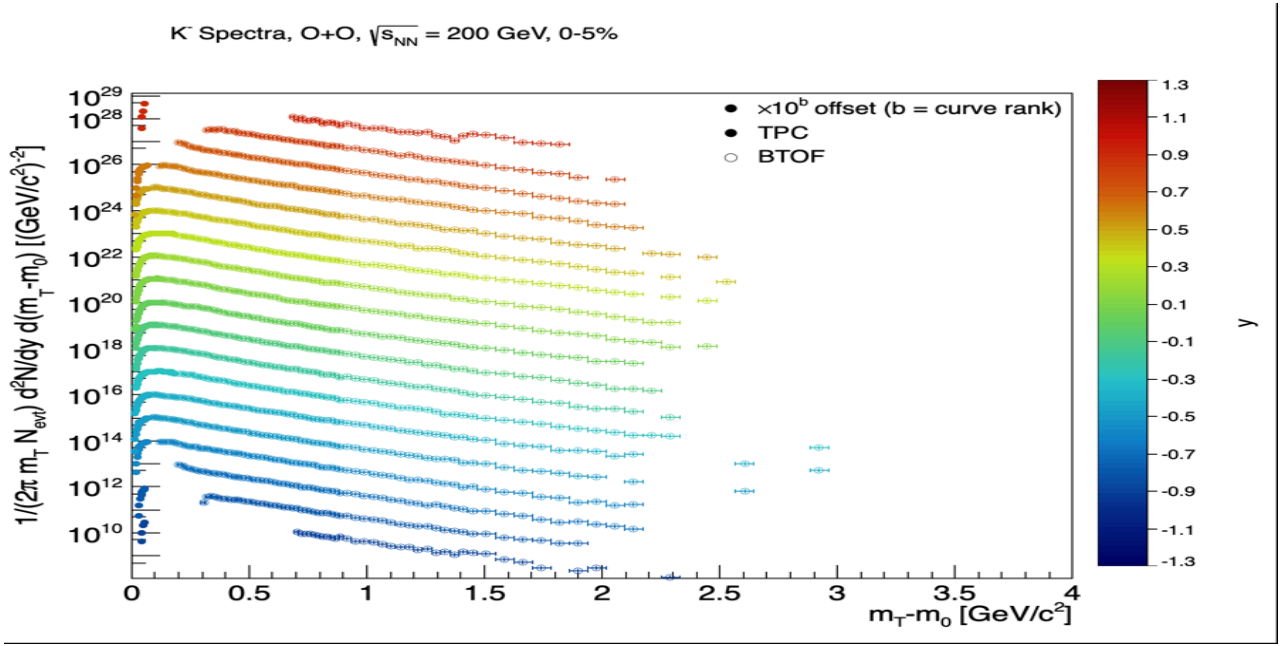

BTOF-corrected kaon+ mT-m0 spectra, 40-80% centrality, TPC+BTOF, all rapidity bins.

Kaon+: 80-100% Centrality

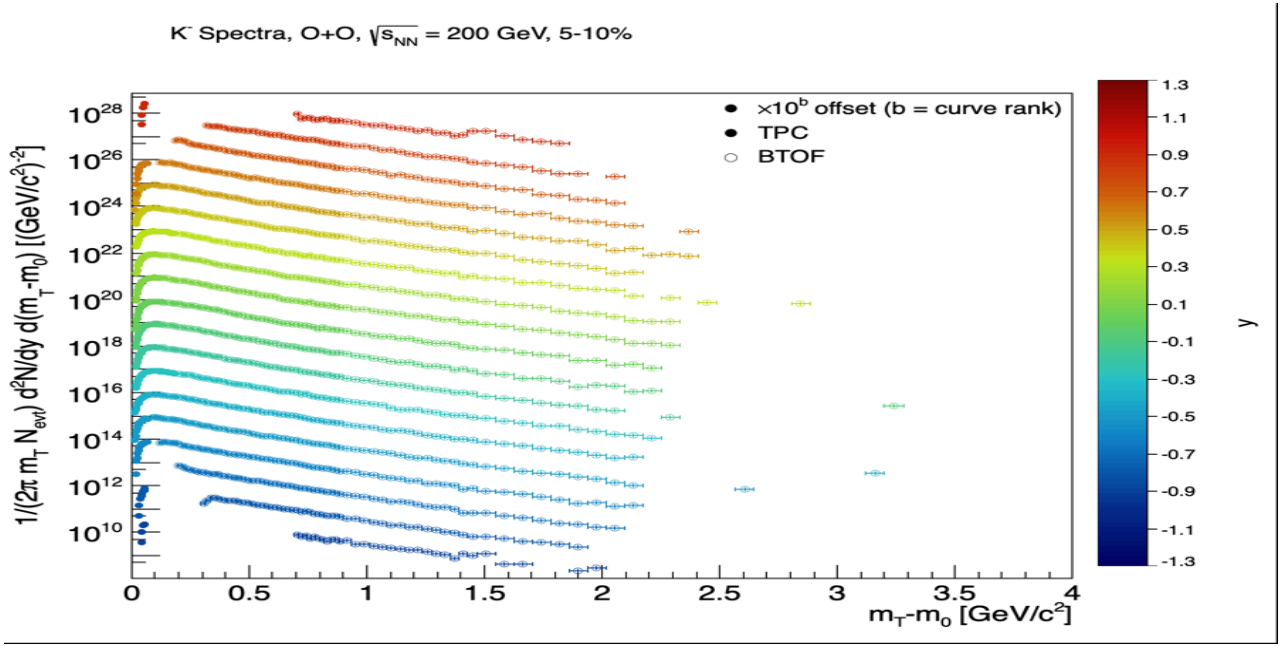

BTOF-corrected kaon+ mT-m0 spectra, 80-100% centrality, TPC+BTOF, all rapidity bins.

Kaon-: 0-5% Centrality

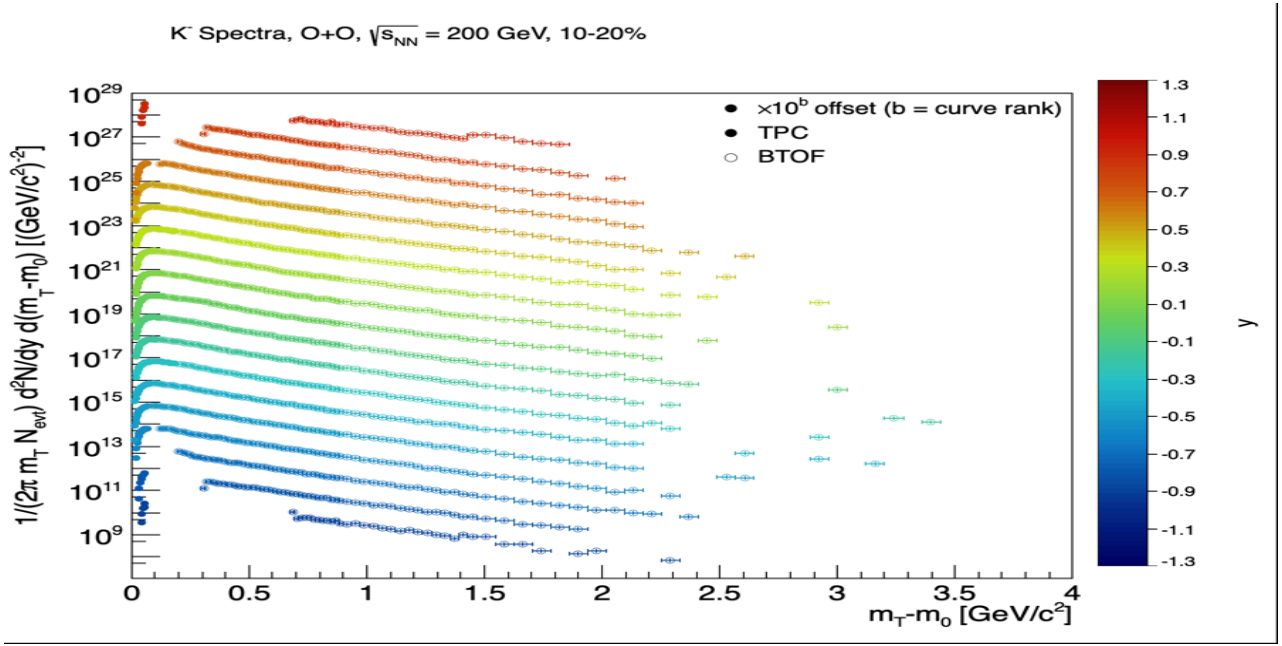

BTOF-corrected kaon- mT-m0 spectra, 0-5% centrality, TPC+BTOF, all rapidity bins.

Kaon-: 5-10% Centrality

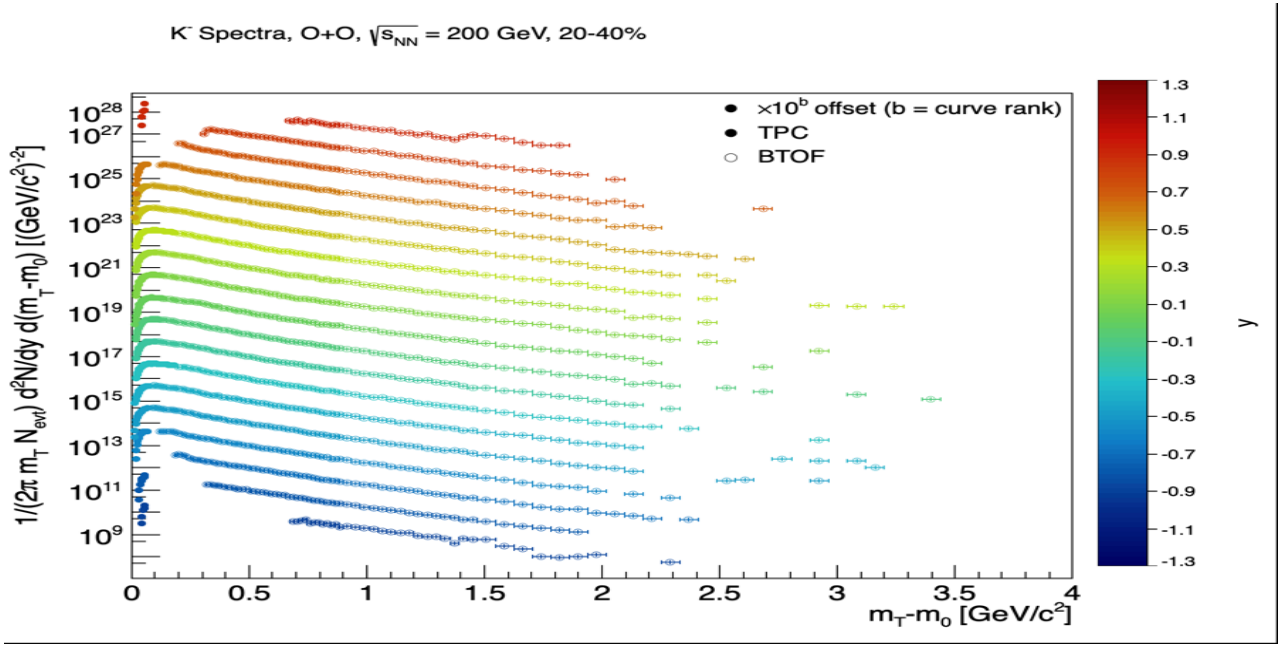

BTOF-corrected kaon- mT-m0 spectra, 5-10% centrality, TPC+BTOF, all rapidity bins.

Kaon-: 10-20% Centrality

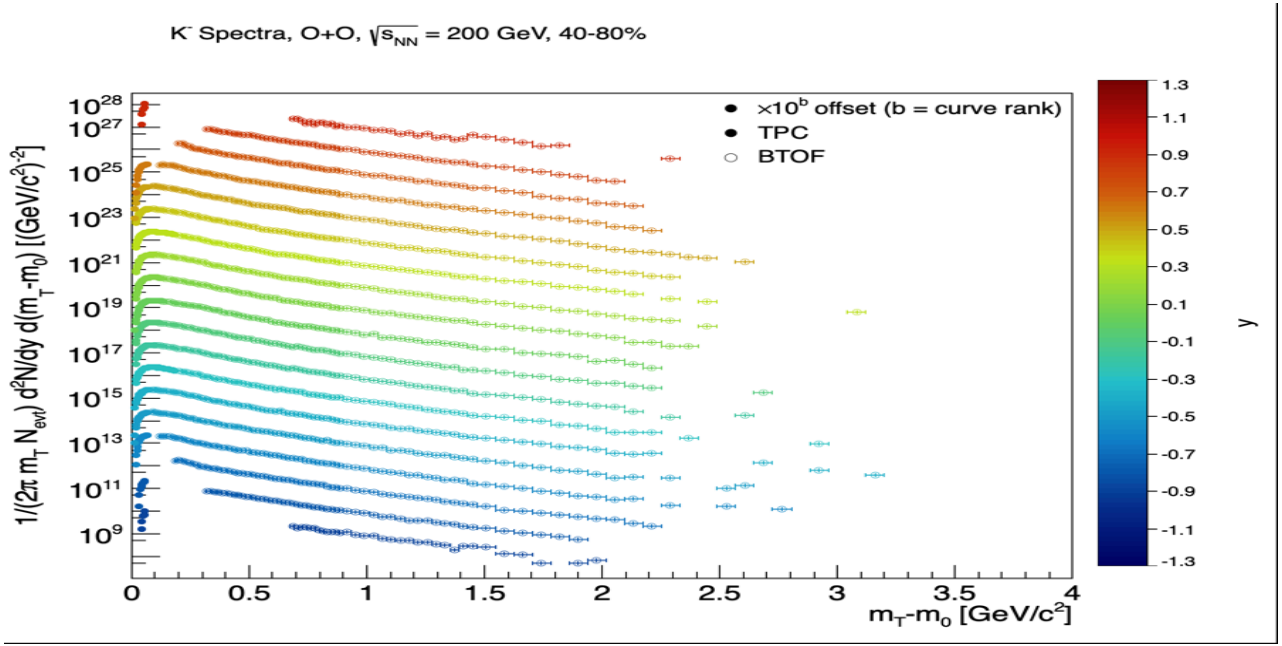

BTOF-corrected kaon- mT-m0 spectra, 10-20% centrality, TPC+BTOF, all rapidity bins.

Kaon-: 20-40% Centrality

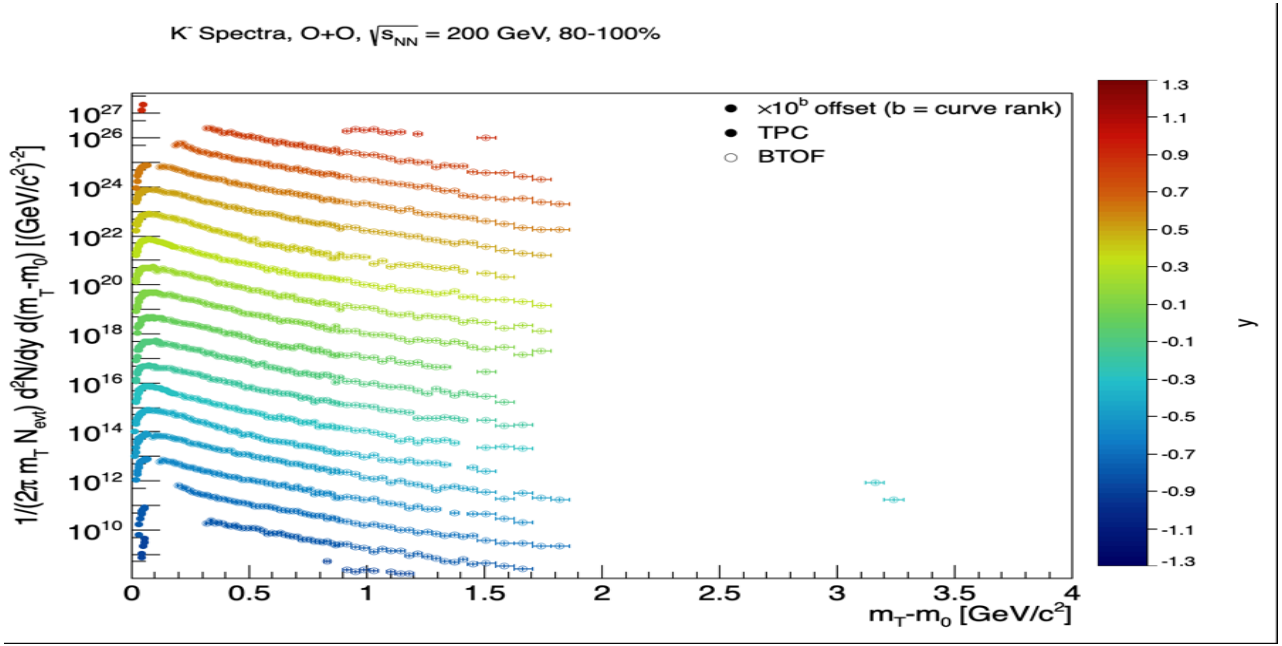

BTOF-corrected kaon- mT-m0 spectra, 20-40% centrality, TPC+BTOF, all rapidity bins.

Kaon-: 40-80% Centrality

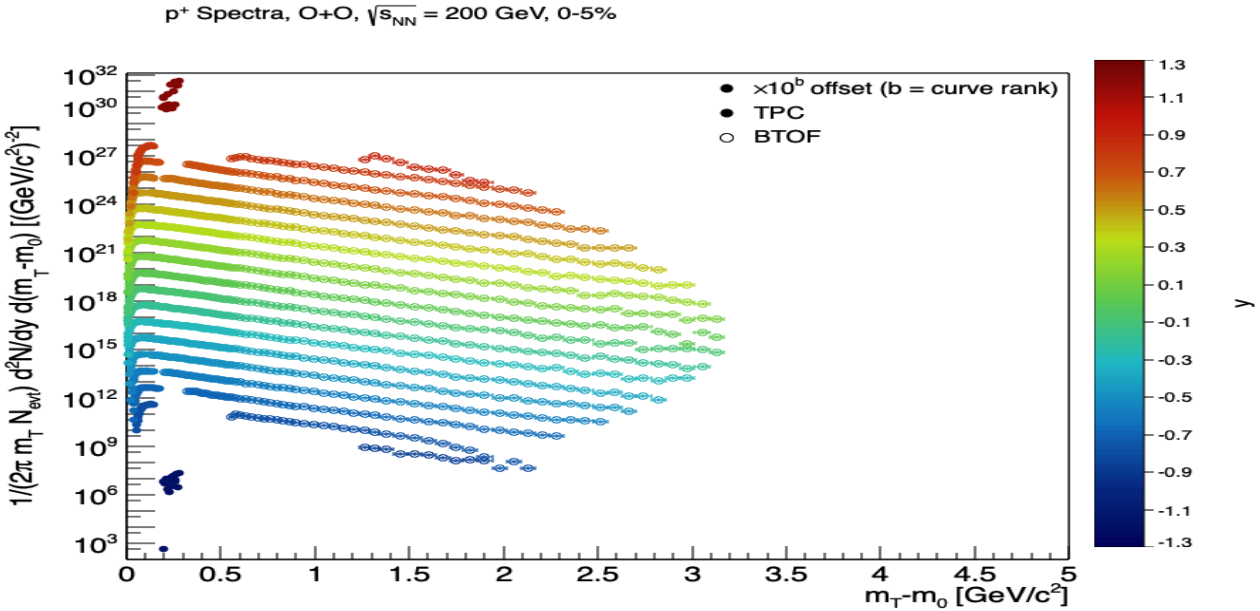

BTOF-corrected kaon- mT-m0 spectra, 40-80% centrality, TPC+BTOF, all rapidity bins.

Kaon-: 80-100% Centrality

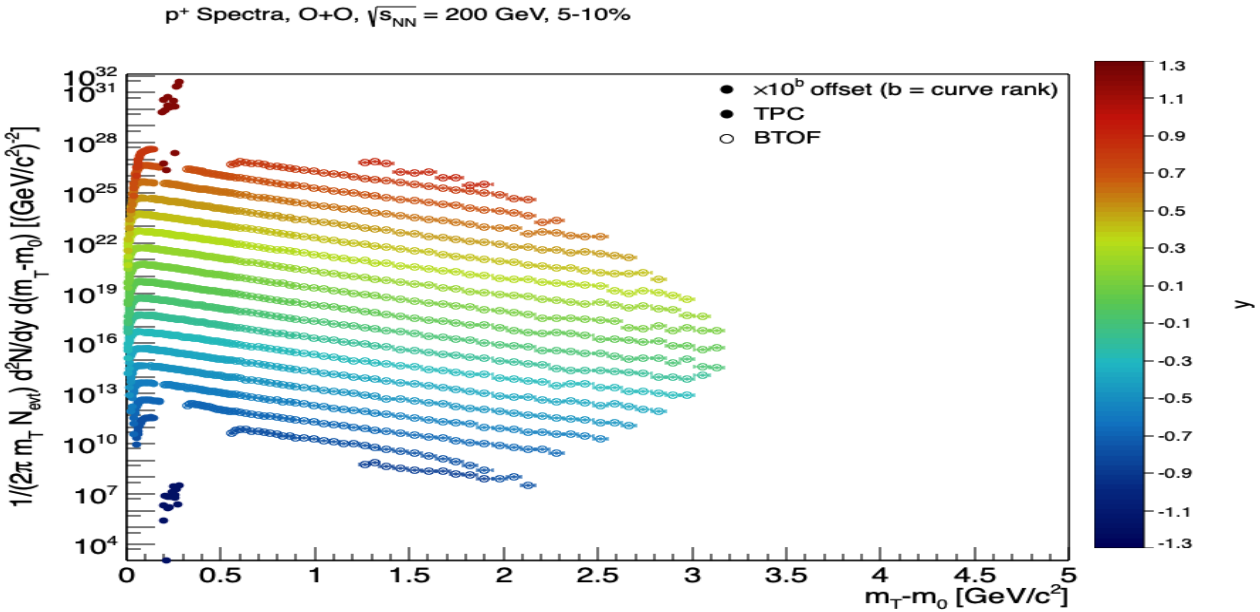

BTOF-corrected kaon- mT-m0 spectra, 80-100% centrality, TPC+BTOF, all rapidity bins.

Proton+: 0-5% Centrality

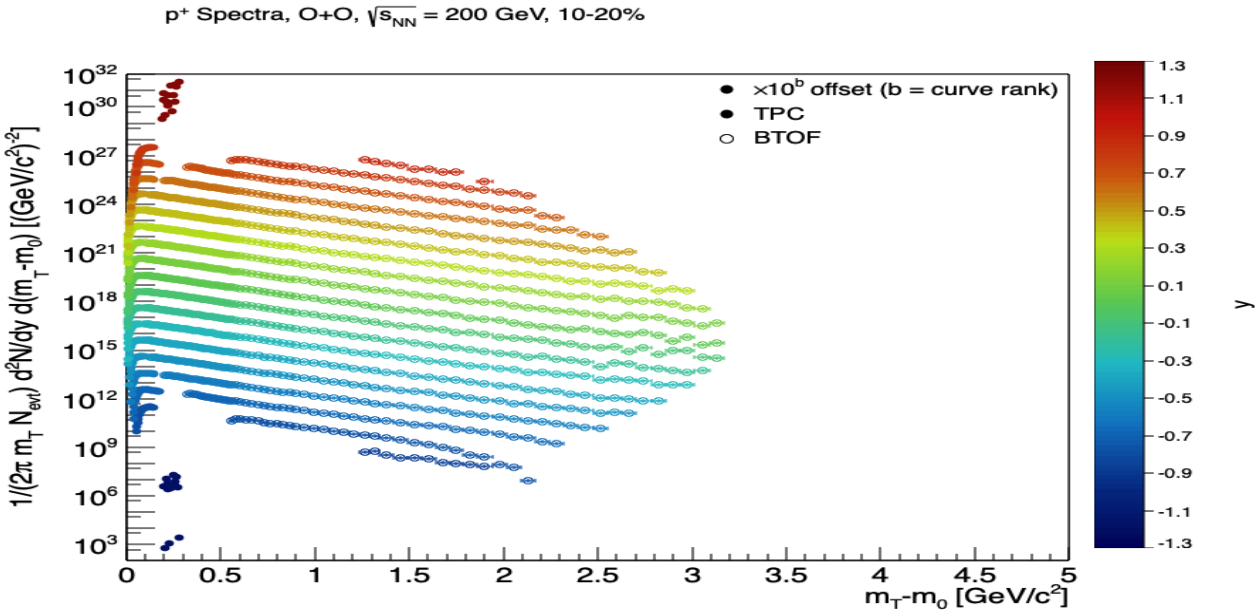

BTOF-corrected proton+ mT-m0 spectra, 0-5% centrality, TPC+BTOF, all rapidity bins.

Proton+: 5-10% Centrality

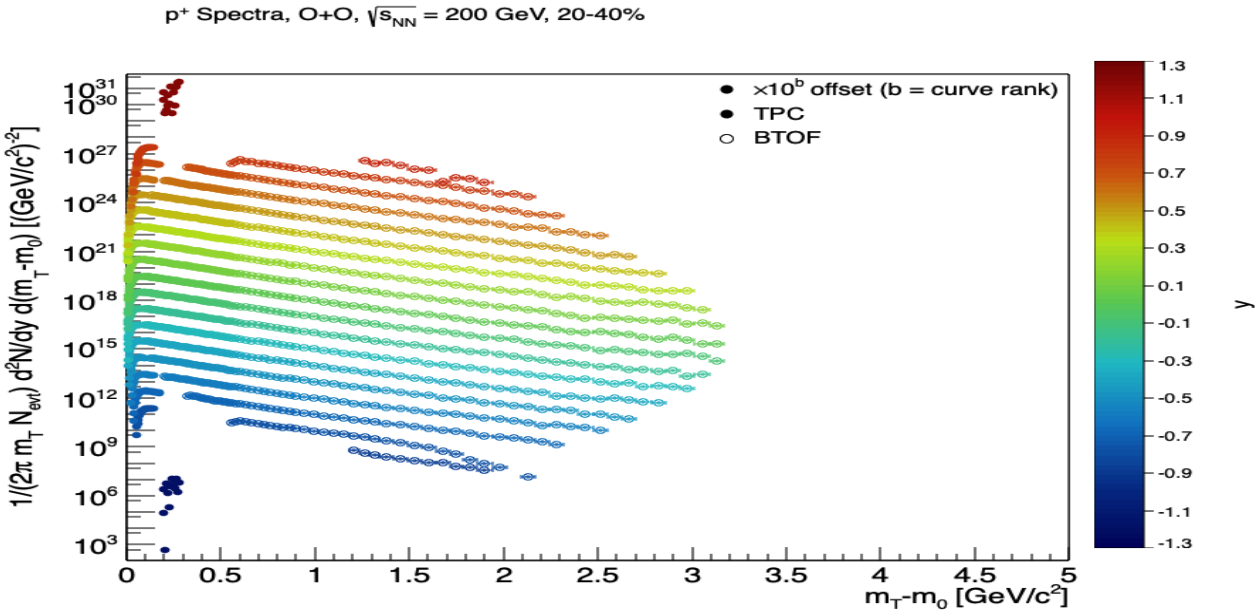

BTOF-corrected proton+ mT-m0 spectra, 5-10% centrality, TPC+BTOF, all rapidity bins.

Proton+: 10-20% Centrality

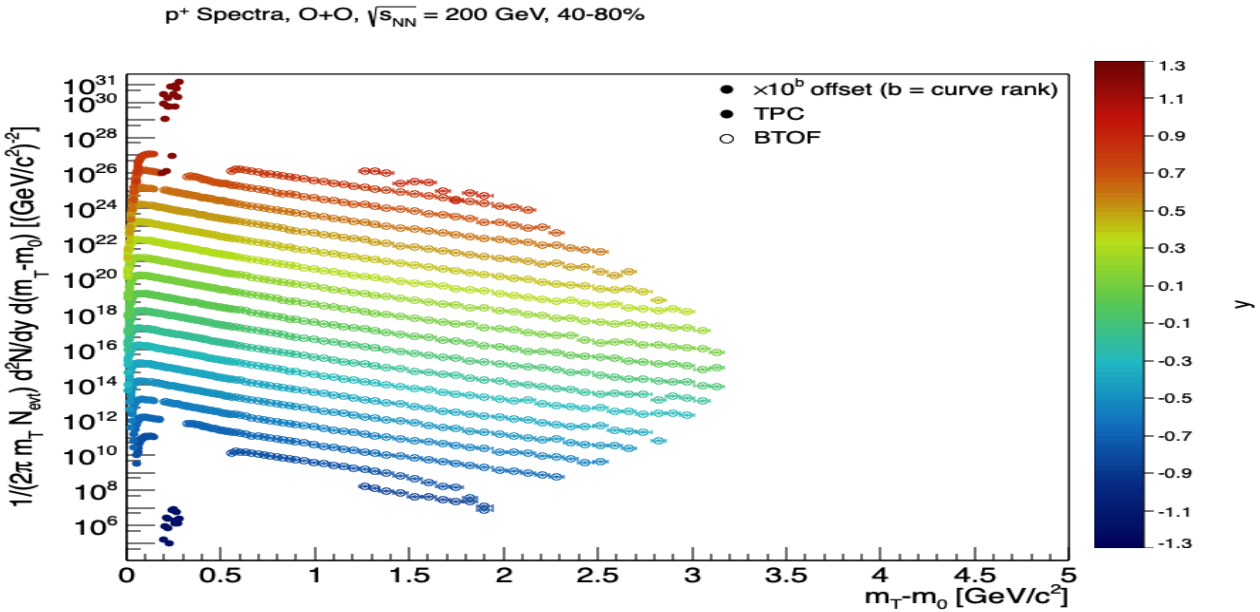

BTOF-corrected proton+ mT-m0 spectra, 10-20% centrality, TPC+BTOF, all rapidity bins.

Proton+: 20-40% Centrality

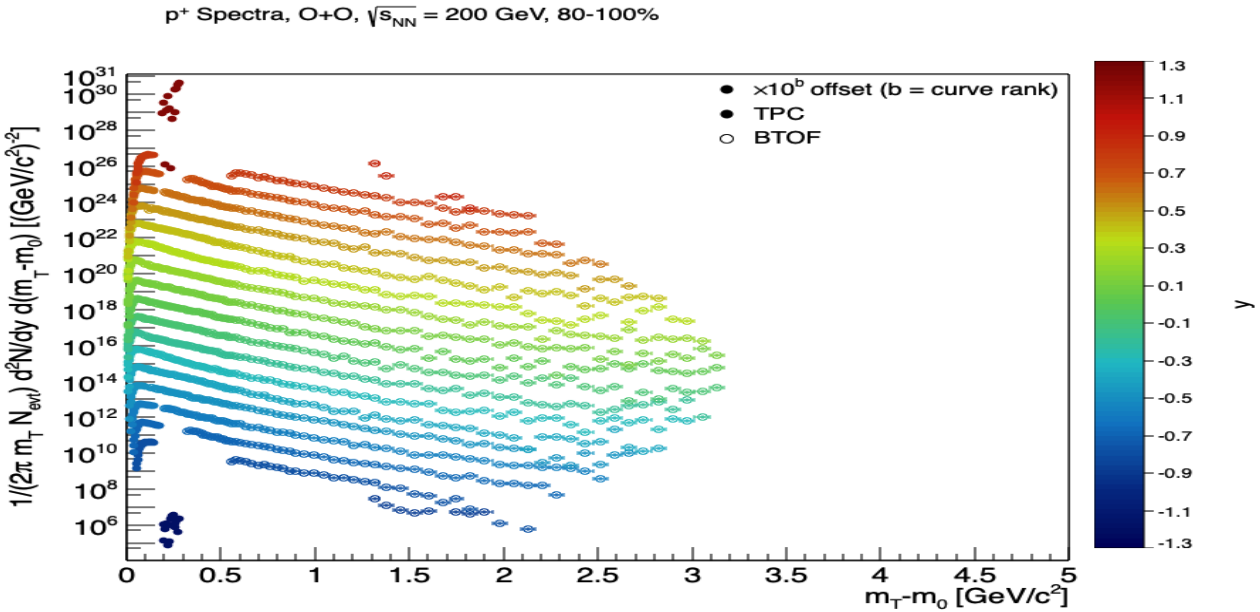

BTOF-corrected proton+ mT-m0 spectra, 20-40% centrality, TPC+BTOF, all rapidity bins.

Proton+: 40-80% Centrality

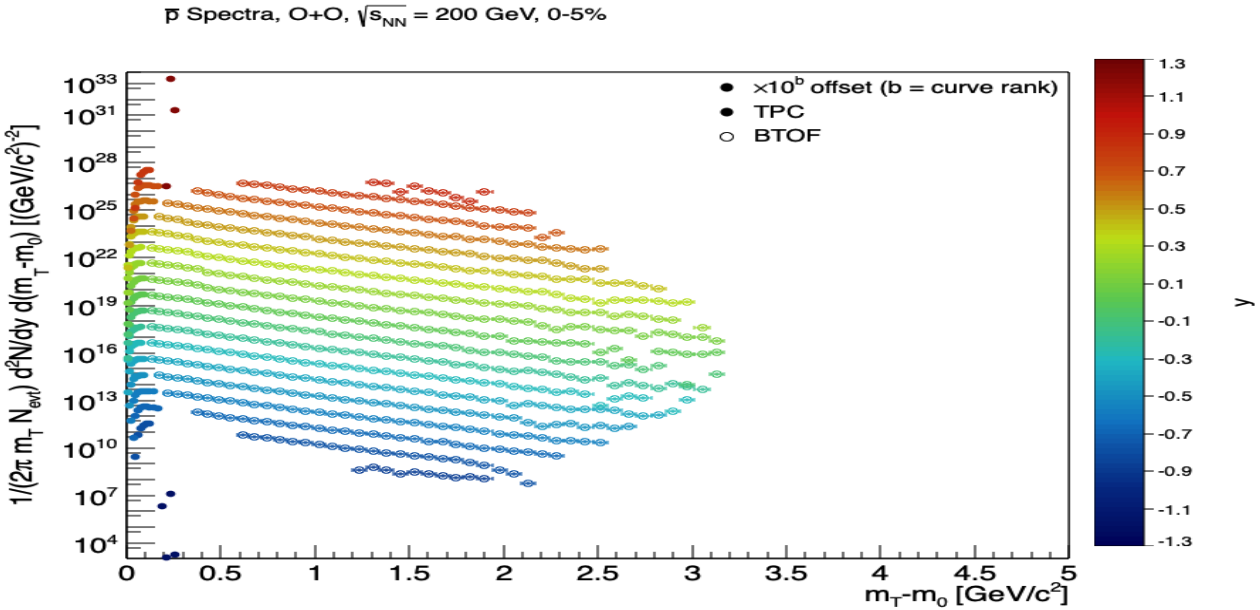

BTOF-corrected proton+ mT-m0 spectra, 40-80% centrality, TPC+BTOF, all rapidity bins.

Proton+: 80-100% Centrality

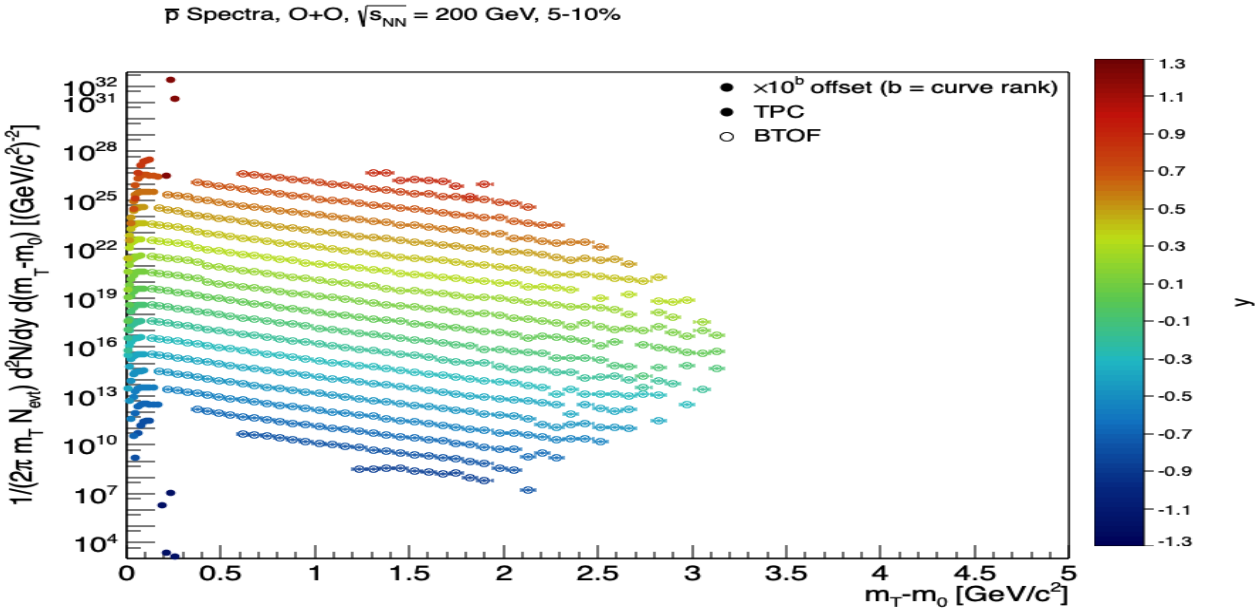

BTOF-corrected proton+ mT-m0 spectra, 80-100% centrality, TPC+BTOF, all rapidity bins.

Antiproton: 0-5% Centrality

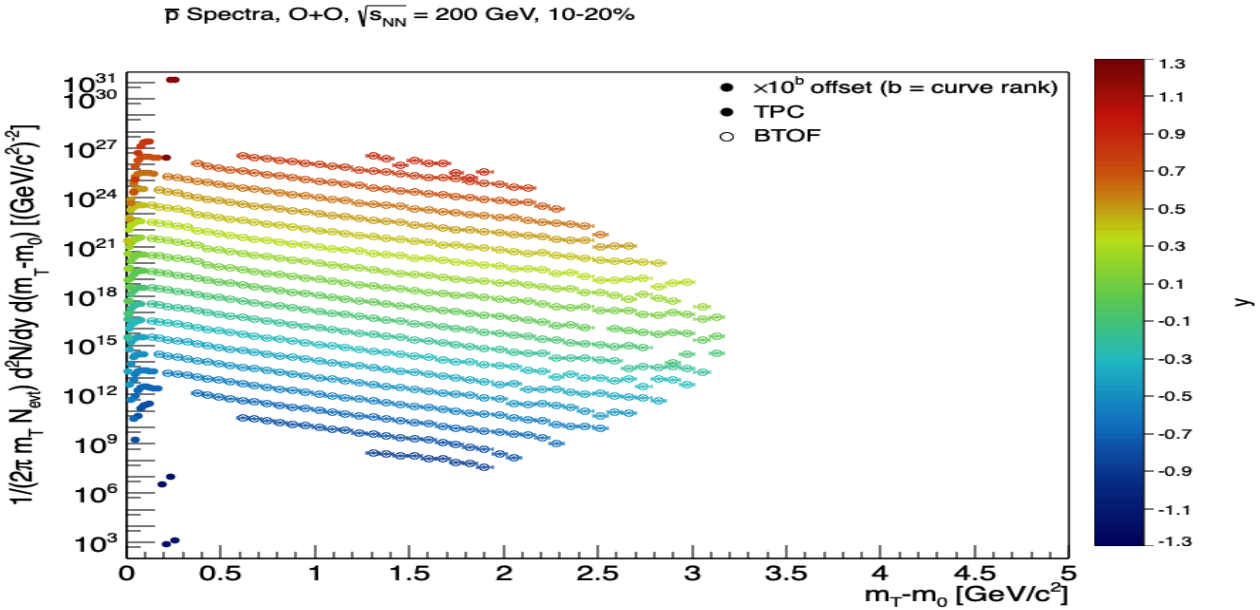

BTOF-corrected antiproton mT-m0 spectra, 0-5% centrality, TPC+BTOF, all rapidity bins.

Antiproton: 5-10% Centrality

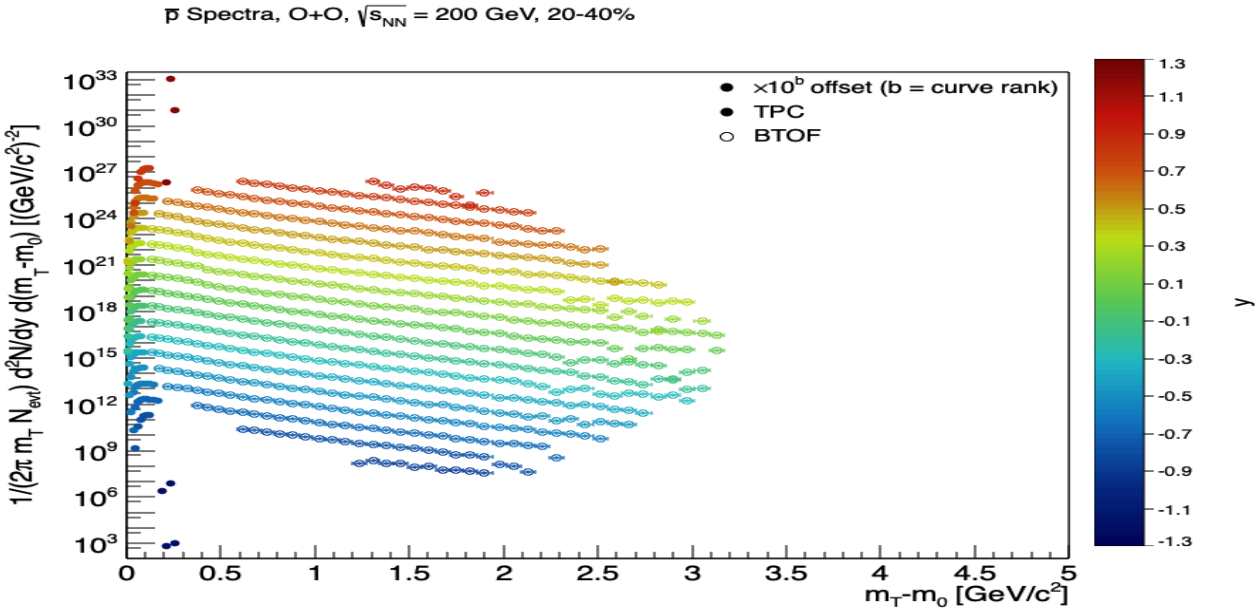

BTOF-corrected antiproton mT-m0 spectra, 5-10% centrality, TPC+BTOF, all rapidity bins.

Antiproton: 10-20% Centrality

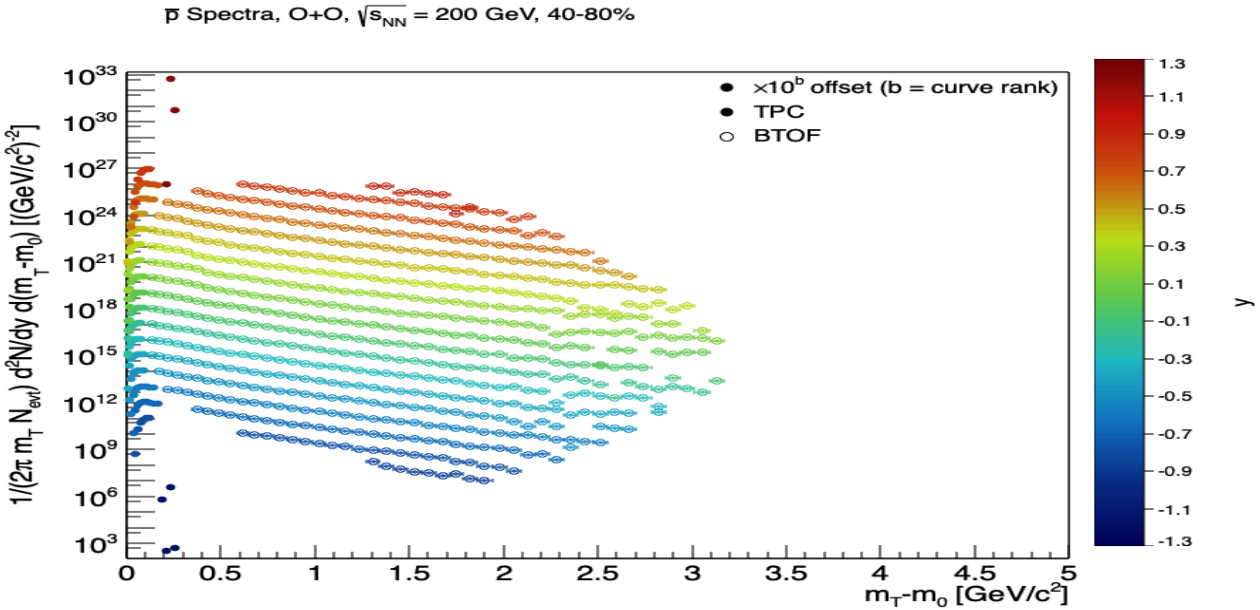

BTOF-corrected antiproton mT-m0 spectra, 10-20% centrality, TPC+BTOF, all rapidity bins.

Antiproton: 20-40% Centrality

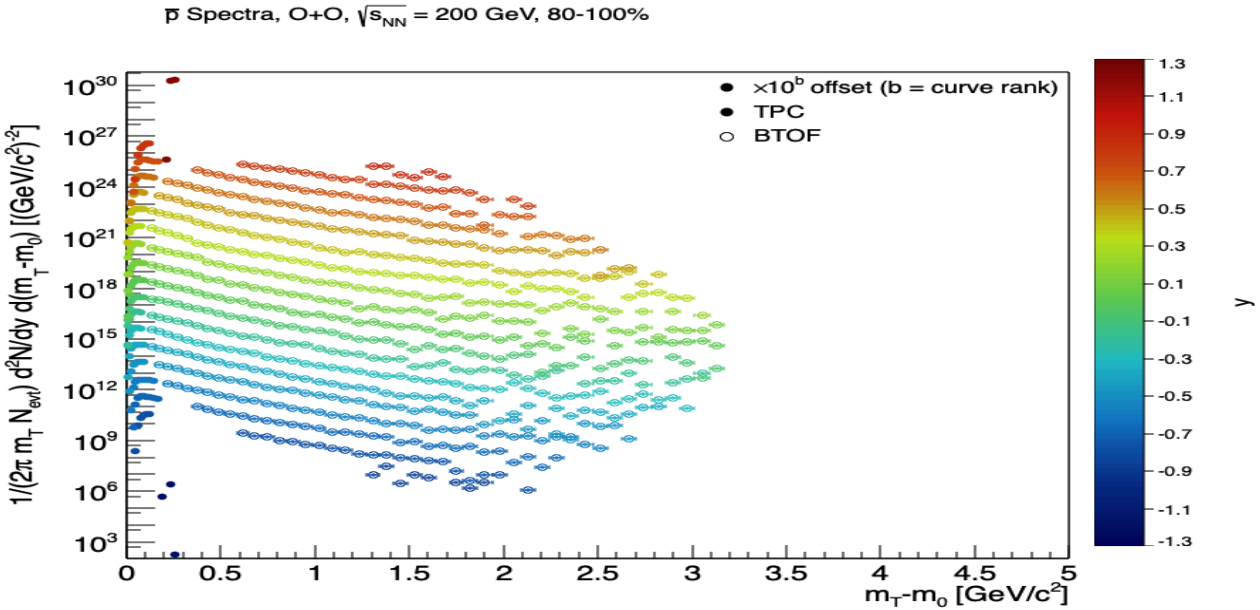

BTOF-corrected antiproton mT-m0 spectra, 20-40% centrality, TPC+BTOF, all rapidity bins.

Antiproton: 40-80% Centrality

BTOF-corrected antiproton mT-m0 spectra, 40-80% centrality, TPC+BTOF, all rapidity bins.

Antiproton: 80-100% Centrality

BTOF-corrected antiproton mT-m0 spectra, 80-100% centrality, TPC+BTOF, all rapidity bins.
